Nokia reserves the right to revise this document or withdraw it at any time without prior notice.

The availability of particular products may vary by region.

IMPORTANT

This document is intended for use by qualified service personnel only.

Warnings and cautions

Warnings

- IF THE DEVICE CAN BE INSTALLED IN A VEHICLE, CARE MUST BE TAKEN ON INSTALLATION IN VEHICLES FITTED WITH ELECTRONIC ENGINE MANAGEMENT SYSTEMS AND ANTI-SKID BRAKING SYSTEMS. UNDER CERTAIN FAULT CONDITIONS, EMITTED RF ENERGY CAN AFFECT THEIR OPERATION. IF NECESSARY, CONSULT THE VEHICLE DEALER/ MANUFACTURER TO DETERMINE THE IMMUNITY OF VEHICLE ELECTRONIC SYSTEMS TO RF ENERGY.
- THE PRODUCT MUST NOT BE OPERATED IN AREAS LIKELY TO CONTAIN POTENTIALLY EXPLOSIVE ATMOSPHERES, FOR EXAMPLE, PETROL STATIONS (SERVICE STATIONS), BLASTING AREAS ETC.
- OPERATION OF ANY RADIO TRANSMITTING EQUIPMENT, INCLUDING CELLULAR TELEPHONES, MAY INTERFERE WITH THE FUNCTIONALITY OF INADEQUATELY PROTECTED MEDICAL DEVICES. CONSULT A PHYSICIAN OR THE MANUFACTURER OF THE MEDICAL DEVICE IF YOU HAVE ANY QUESTIONS. OTHER ELECTRONIC EQUIPMENT MAY ALSO BE SUBJECT TO INTERFERENCE.
- BEFORE MAKING ANY TEST CONNECTIONS, MAKE SURE YOU HAVE SWITCHED OFF ALL EQUIPMENT.

Cautions

- Servicing and alignment must be undertaken by qualified personnel only.
- Ensure all work is carried out at an anti-static workstation and that an anti-static wrist strap is worn.
- Ensure solder, wire, or foreign matter does not enter the telephone as damage may result.
- Use only approved components as specified in the parts list.
- Ensure all components, modules, screws and insulators are correctly re-fitted after servicing and alignment.
- Ensure all cables and wires are repositioned correctly.
- Never test a mobile phone WCDMA transmitter with full Tx power, if there is no possibility to perform the measurements in a good performance RF-shielded room. Even low power WCDMA transmitters may disturb nearby WCDMA networks and cause problems to 3G cellular phone communication in a wide area.
- During testing never activate the GSM or WCDMA transmitter without a proper antenna load, otherwise GSM or WCDMA PA may be damaged.

For your safety

QUALIFIED SERVICE

Only qualified personnel may install or repair phone equipment.

ACCESSORIES AND BATTERIES

Use only approved accessories and batteries. Do not connect incompatible products.

CONNECTING TO OTHER DEVICES

When connecting to any other device, read its user's guide for detailed safety instructions. Do not connect incompatible products.

ESD protection

Nokia requires that service points have sufficient ESD protection (against static electricity) when servicing the phone.

Any product of which the covers are removed must be handled with ESD protection. The SIM card can be replaced without ESD protection if the product is otherwise ready for use.

To replace the covers ESD protection must be applied.

All electronic parts of the product are susceptible to ESD. Resistors, too, can be damaged by static electricity discharge.

All ESD sensitive parts must be packed in metallized protective bags during shipping and handling outside any ESD Protected Area (EPA).

Every repair action involving opening the product or handling the product components must be done under ESD protection.

ESD protected spare part packages MUST NOT be opened/closed out of an ESD Protected Area.

For more information and local requirements about ESD protection and ESD Protected Area, contact your local Nokia After Market Services representative.

Care and maintenance

This product is of superior design and craftsmanship and should be treated with care. The suggestions below will help you to fulfil any warranty obligations and to enjoy this product for many years.

- Keep the phone and all its parts and accessories out of the reach of small children.
- Keep the phone dry. Precipitation, humidity and all types of liquids or moisture can contain minerals that will corrode electronic circuits.
- Do not use or store the phone in dusty, dirty areas. Its moving parts can be damaged.
- Do not store the phone in hot areas. High temperatures can shorten the life of electronic devices, damage batteries, and warp or melt certain plastics.
- Do not store the phone in cold areas. When it warms up (to its normal temperature), moisture can form inside, which may damage electronic circuit boards.
- Do not drop, knock or shake the phone. Rough handling can break internal circuit boards.
- Do not use harsh chemicals, cleaning solvents, or strong detergents to clean the phone.
- Do not paint the phone. Paint can clog the moving parts and prevent proper operation.
- Use only the supplied or an approved replacement antenna. Unauthorised antennas, modifications or attachments could damage the phone and may violate regulations governing radio devices.

All of the above suggestions apply equally to the product, battery, charger or any accessory.

Company policy

Our policy is of continuous development; details of all technical modifications will be included with service bulletins.

While every endeavour has been made to ensure the accuracy of this document, some errors may exist. If any errors are found by the reader, NOKIA MOBILE PHONES Business Group should be notified in writing/e-mail.

Battery information

Note: A new battery's full performance is achieved only after two or three complete charge and discharge cycles!

The battery can be charged and discharged hundreds of times but it will eventually wear out. When the operating time (talk-time and standby time) is noticeably shorter than normal, it is time to buy a new battery.

Use only batteries approved by the phone manufacturer and recharge the battery only with the chargers approved by the manufacturer. Unplug the charger when not in use. Do not leave the battery connected to a charger for longer than a week, since overcharging may shorten its lifetime. If left unused a fully charged battery will discharge itself over time.

Temperature extremes can affect the ability of your battery to charge.

For good operation times with Li-Ion batteries, discharge the battery from time to time by leaving the product switched on until it turns itself off (or by using the battery discharge facility of any approved accessory available for the product). Do not attempt to discharge the battery by any other means.

Use the battery only for its intended purpose.

Never use any charger or battery which is damaged.

Do not short-circuit the battery. Accidental short-circuiting can occur when a metallic object (coin, clip or pen) causes direct connection of the + and - terminals of the battery (metal strips on the battery) for example when you carry a spare battery in your pocket or purse. Short-circuiting the terminals may damage the battery or the connecting object.

Leaving the battery in hot or cold places, such as in a closed car in summer or winter conditions, will reduce the capacity and lifetime of the battery. Always try to keep the battery between 15°C and 25°C (59°F and 77°F). A phone with a hot or cold battery may temporarily not work, even when the battery is fully charged. Batteries' performance is particularly limited in temperatures well below freezing.

Do not dispose of batteries in a fire!

Dispose of batteries according to local regulations (e.g. recycling). Do not dispose as household waste.

■ Product selection

RM-626 is a GSM/WCDMA dual-mode handportable multimedia computer with a capacitive touch UI, integrated GPS (A-GPS OMA SUPL), WLAN and a TV-out connection. It supports GSM 850/900/1800/1900 and WCDMA I/II/IV/V/VIII bands, GPRS/EGPRS and WCDMA/HSDPA/HSUPA data bearers.

For WCDMA the maximum bit rate is up to 384 kbit/s for downlink and 384 kbit/s for uplink with simultaneous CS speech or CS video (max. 64 kbit/s). RM-626 supports HSDPA category 9 with downlink peak data rate up to 10.2 Mbit/s (in limited use cases), HSUPA belongs to category 5 with uplink peak data rate up to 2.0 Mbit/s (in limited use cases).

In PS/CS mode, RM-626 supports DTM with multi slot class 32 (max. 5 RX + 3 TX, sum 6). With EGPRS this means maximum download speed of up to 236.8 kbit/s simultaneously with speech. With GPRS this means maximum download speed of up to 85.6 kbit/s simultaneously with speech.

In PS only mode, RM-626 supports MSC 33 (max. 5 Rx + 4 TX, sum 6) timeslots resulting in maximum download speed of up to 296 kbit/s with EGPRS, and up to 107 kbit/s with GPRS.

RM-626 has a large AMOLED nHD 4" (640 x 360 pixels) display (active area 49.14 mm x 87.36 mm) with 16 million colors. It also has an 8 megapixel EDOF camera, 2 x digital zoom and an integrated dual LED flash. The device supports two-way video calls with two integrated cameras, one on the front and one on the back.

The MMS implementation follows the OMA MMS standard release 1.3. The browser is a highly advanced Internet browser also capable of viewing operator domain XHTML Mobile Profile (MP) content. The device also supports Bluetooth 3.0 standard.

RM-626 uses Symbian ^3 for Nokia devices operating system, and supports the full Web Browser for S60, which brings desktop-like Web browsing experience to mobile devices. It also supports MIDP Java 2.1 , providing a good platform for compelling 3rd party applications.

Figure 1 View of RM-626

■ Product features and sales package

Imaging

Main camera:

- Sensor: 8 megapixel EDOF (Extended Depth of Field)
- F number/Aperture: F2.8
- Digital zoom: 2x
- Flash: Integrated dual LED flash

Secondary camera:

- Sensor: CMOS
- Still image resolutions: VGA (640 x 480 pixels)
- Video resolutions: QCIF

Video:

- Video resolution: HD at 25 fps or VGA at 30 fps
- Audio recording: AAC (AMR for MMS)
- Video stabilization
- Video clip length: Max. 90 min
- Video file format: .mp4 (default), .3gp (for MMS)
- White balance: automatic, sunny, cloudy, incandescent, fluorescent
- Scene: automatic, low light, night
- Colour tone: normal, sepia, B&W, vivid, negative
- Zoom (digital): 3x
- Video recording indicator

Photo:

- Still image resolutions: up to 8 megapixel: 3280 x 2464
- Aspect ratio: 16:9 or 4:3
- View finder: full screen view finder (6MPix)
- Still image file format: JPEG/EXIF
- Auto exposure: center weighted AE
- Image orientation: automatic
- Automatic red eye removal
- Face tracking
- Exposure compensation: +2 ~ -2EV at 0.5 step
- White balance: automatic, sunny, cloudy, incandescent, fluorescent
- Scene: automatic, portrait, landscape, night, night portrait, user defined
- Colour tone: normal, sepia, B&W, vivid, negative
- Zoom (digital): 2x

Edit

- On device Photo editor and Video editor (manual & automatic)

View

- 4" nHD (640 x 360 pixels) color display (active area 49.14 mm x 87.36 mm), up to 16M colors, 16:9 aspect ratio
- Digital Ambient Light Sensor (ALS) – used to optimize display/key brightness and power consumption
- Slideshow from Gallery

Share

- Nokia XpressShare - share effortlessly from Gallery or after capture via Email, Bluetooth or MMS
- Direct connection to TV via cable or WLAN (UPnP)
- Video call and video sharing support. (WCDMA services)
- Online Album: Image/Video uploading from Gallery

Print

- Nokia XpressPrint – direct printing via USB (PictBridge), Bluetooth (BPP), and WLAN (UPnP), from memory card or via online printing

Store

- 16 GB internal user memory
- Nokia XpressTransfer – easy to transfer and organize photos and video between your device and a compatible PC
- Nokia Lifeblog (mobile & PC)

Music

- Digital music player: supports MP3/ AAC/ eAAC/ eAAC+/ WMA/ AMR-NB/ AMR-WB with playlists, equalizer and album art
- Synchronise music with Microsoft Windows Media Player 10 & 11
- One click CD ripping, converting and transferring music to your device using Nokia Music Manager
- Stereo FM radio (87.5-108 MHz /76-90 MHz) with Visual Radio™ support
- Bluetooth speakers
- Integrated handsfree speaker
- Nokia Music Headset (WH-205), inbox

Media

- Full-screen video playback to view downloaded, streamed or recorded video clips
- Supported video formats: MPEG-4 , H.264/AVC, H.263/3GPP, VC-1, Real Video 10, ON2 VP6, Flash video

Productivity

Context management:

- OMA DRM version 2.0
- OTA provisioning & over the air SW update (FOTA)
- Ovi Suite
- Web Browser (OSS), Java™ MIDP 2.1, XHTML browsing over TCP/IP

Messaging:

- E-mail (SMTP, IMAP4, POP3), MMS, SMS, unified editor

- IM client

Office applications:

- Viewing of email attachments – .doc, .xls, .ppt, .pdf, .zip, .jpg
- Mail for Exchange

PIM:

- Contacts, calendar, to-do, notes, recorder, calculator, clock, converter

Synchronization:

- Local/Remote (using SyncML)
 - Data: Calendar, Contacts, To-do, Notes, E-mail
 - PC Applications: Microsoft Outlook (98, 2000, 2002, 2003), Outlook Express, Lotus Organizer (5.0, 6.0), Lotus Notes (5.0, 6.0)

Call management:

- Call logs, speed dial, voice dialling (with SIND) and voice commands
- Nokia Push to Talk (PoC)

Connectivity

- Integrated GPS (A-GPS OMA SUPL)
- Nokia Maps 3.0, including Friend Finder
- WLAN - IEEE802.11 g/b/n with UPnP support
- HDMI type C connector
- Micro USB interface with USB 2.0 high speed
- Bluetooth wireless technology 3.0
- Nokia 3.5 mm AV connector

Add-on software framework

- Symbian ^3 for Nokia devices
- Java: MIDP2.1
- C++ and Java SDKs
- Flash Lite 4.0

Additional technical specifications

- Vibrating alert
- 3GPP Rel 5/6 WCDMA , Rel 4 EGSM compliant
- Speech codecs supported: AMR, NB AMR, WB AMR, FR, EFR
- GPRS/EGPRS Class B, Multi slot class 33
- Dual Transfer Mode (DTM) class A, multi slot class 32
- WCDMA DL 384 kbit/s, UL 384 kbit/s
- HSDPA up to 10.2 Mbps, HSUPA 2 Mbps

Sales package

- Transceiver RM-626
- Battery (BL-4D, embedded)
- Charger (AC-10)

- Music headset (WH-205)
- Connectivity cable (CA-179)
- Micro USB OTG to USB adapter (CA-157)
- Quick Guide

Transceiver general specifications

Unit	Dimensions (L x W x T) (mm)	Weight (g)	Volume (cm ³)
Transceiver with BL-4D 1200 mAh Li-ion battery pack	123.7 x 62.4 x 13.6	175	97.8

Main RF characteristics for GSM850/900/1800/1900 and WCDMA VIII/V/IV/II/I phones

Parameter	Unit
Cellular system	GSM850, EGSM900, GSM1800/1900, WCDMA VIII (900), WCDMA V (850), WCDMA IV (1700/2100), WCDMA II (1900) and WCDMA I (2100)

Parameter	Unit
Rx frequency band	GSM850: 869 - 894MHz
	EGSM900: 925 - 960 MHz
	GSM1800: 1805 - 1880 MHz
	GSM1900: 1930 - 1990 MHz
	WCDMA VIII (900): 925 - 960 MHz
	WCDMA V (850): 869 - 894 MHz
	WCDMA IV (1700/2100): 2110 - 2155 MHz
	WCDMA II (1900): 1930 - 1990 MHz
	WCDMA I (2100): 2110 - 2170 MHz
Tx frequency band	GSM850: 824 - 849 MHz
	EGSM900: 880 - 915 MHz
	GSM1800: 1710 - 1785 MHz
	GSM1900: 1850 - 1910 MHz
	WCDMA VIII (900): 880 - 915 MHz
	WCDMA V (850): 824 - 849 MHz
	WCDMA IV (1700/2100): 1710 - 1755 MHz
	WCDMA II (1900): 1850 - 1910 MHz
	WCDMA I (2100): 1920 - 1980 MHz
Output power	GSM850: +5 ... +33 dBm/3.2 mW ... 2 W
	GSM900: +5 ... +33 dBm/3.2 mW ... 2 W
	GSM1800: +0 ... +30 dBm/1.0 mW ... 1 W
	GSM1900: +0 ... +30 dBm/1.0 mW ... 1 W
	WCDMA VIII (900): -50 ... +24 dBm/0.01 µW ... 251 mW
	WCDMA V (850): -50 ... +24 dBm/0.01 µW ... 251 mW
	WCDMA IV (1700/2100): -50 ... +24 dBm/0.01 µW ... 251 mW
	WCDMA II (1900): -50 ... +24 dBm/0.01 µW ... 251 mW
	WCDMA I (2100): -50 ... +24 dBm/0.01 µW ... 251 mW
EDGE output power	EDGE850: +5 ... +27 dBm/3.2 mW ... 501 mW
	EDGE900: +5 ... +27 dBm/3.2 mW ... 501 mW
	EDGE1800: +0 ... +26 dBm/1.0 mW ... 398 mW
	EDGE1900: +0 ... +26 dBm/1.0 mW ... 398 mW

Parameter	Unit
Number of RF channels	GSM850: 124
	GSM900: 174
	GSM1800: 374
	GSM1900: 299
	WCDMA VIII (900): 152
	WCDMA V (850): 108
	WCDMA IV (1700/2100): 211
	WCDMA II (1900): 289
	WCDMA I (2100): 277
Channel spacing	200 kHz (WCDMA II, IV and V 100/200 kHz)
Number of Tx power levels	GSM850: 15
	GSM900: 15
	GSM1800: 16
	GSM1900: 16
	WCDMA VIII (900): 75
	WCDMA V (850): 75
	WCDMA IV (1700/2100): 75
	WCDMA II (1900): 75
	WCDMA I (2100): 75

Battery endurance

Battery	Capacity (mAh)	Talk time	Stand-by	Music playback	Video playback H.264 720p 30fps
BL-4D	1200	Up to 9 h (GSM) Up to 5 h (WCDMA)	Up to 430 h (GSM) Up to 470 h (WCDMA)	Up to 50 h	Up to 7 h

Environmental conditions

Temperature conditions

Environmental condition	Ambient temperature	Notes
Normal operation	-15°C...+55°C	Specifications fulfilled
Reduced performance	-25°C...-15°C +55°C...+70°C	Operational for shorts periods only

Environmental condition	Ambient temperature	Notes
Intermittent operation	-40°C...-15°C +70°C...+85 °C	Operation not guaranteed but an attempt to operate does not damage the phone.
No operation or storage	<-40°C...>+85°C	No storage or operation: an attempt may damage the phone.
Charging allowed	-10°C...+60°C	BTemp measurement range for charging.
Long term storage conditions	0°C...+85°C	

Humidity

Relative humidity range is 5...95%.

The HW module is not protected against water. Condensed or splashed water might cause malfunction. Any submersion of the phone will cause permanent damage. Long-term high humidity, with condensation, will cause permanent damage because of corrosion.

Vibration

The module should withstand the following vibrations:

- 5 - 10 Hz; +10dB / octave
- 10 - 50 Hz; 5.58 m² / s³ (0.0558 g²/ Hz)
- 50 - 300 Hz; - 10 dB / octave

ESD strength

Conducted discharge is 8 kV (>10 discharges) and air contact 15 kV (>10 discharges).

The standard for electrostatic discharge is IEC 61000-4-2, and this device fulfils level 4 requirements.

RoHS

This device uses RoHS compliant components and lead-free soldering process.

	SS-267	Proximity tuning reflector	
The proximity tuning reflector tool SS-267 is used for proximity tuning.			

General tools

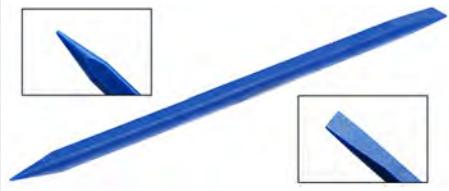

The table below gives a short overview of service devices that can be used for testing, error analysis, and repair of product RM-626. For the correct use of the service devices, and the best effort of workbench setup, please refer to various concepts.

 AC-35	AC-35	Power supply	
Universal power supply for FPS-21; included in the FPS-21 sales package. Input 100V...230V 50Hz...60Hz, output voltage of 12 V and output current up to 3 A.			
 ACF-8	ACF-8	Universal power supply	
The ACF-8 universal power supply is used to power FLS-5.			

CU-4 	<p>CU-4</p> <p>Control unit</p> <p>CU-4 is a general service tool used with a module jig and/or a flash adapter. It requires an external 12 V power supply.</p> <p>The unit has the following features:</p> <ul style="list-style-type: none"> • software controlled via USB • EM calibration function • Forwards FBUS/Flashbus traffic to/from terminal • Forwards USB traffic to/from terminal • software controlled BSI values • regulated VBATT voltage • 2 x USB2.0 connector (Hub) • FBUS and USB connections supported <p>When using CU-4, note the special order of connecting cables and other service equipment:</p> <p>Instructions</p> <ol style="list-style-type: none"> 1 Connect a service tool (jig, flash adapter) to CU-4. 2 Connect CU-4 to your PC with a USB cable. 3 Connect supply voltage (12 V) 4 Connect an FBUS cable (if necessary). 5 Start Phoenix service software.  <p>Note: Phoenix enables CU-4 regulators via USB when it is started. Reconnecting the power supply requires a Phoenix restart.</p>
--------------------------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

	FLS-5	Flash device	
FLS-5 is a dongle and flash device incorporated into one package, developed specifically for POS use.			
<p>FPS-21</p>  <p>The FPS-21 is a specialized service tool for Nokia mobile devices. It features a metal chassis with a heat sink on top. The front panel includes a small LCD screen, several buttons, and a USB port. The back panel has various connectors for power, USB, and Ethernet.</p>	FPS-21	Flash prommer	
<p>FPS-21 sales package:</p> <ul style="list-style-type: none">• FPS-21 prommer• AC-35 power supply• CA-31D USB cable <p>FPS-21 interfaces:</p> <p><i>Front</i></p> <ul style="list-style-type: none">• Service cable connector Provides Flashbus, USB and VBAT connections to a mobile device.• SmartCard socket A SmartCard is needed to allow DCT-4 generation mobile device programming. <p><i>Rear</i></p> <ul style="list-style-type: none">• DC power input For connecting the external power supply (AC-35).• Two USB A type ports (USB1/USB3) Can be used, for example, for connecting external storage memory devices or mobile devices• One USB B type device connector (USB2) For connecting a PC.• Phone connector Service cable connection for connecting Flashbus/FLA.• Ethernet RJ45 type socket (LAN) For connecting the FPS-21 to LAN. <p><i>Inside</i></p> <ul style="list-style-type: none">• Four SD card memory slots For internal storage memory. <p>Note: In order to access the SD memory card slots inside FPS-21, the prommer needs to be opened by removing the front panel, rear panel and heatsink from the prommer body.</p>			

	JXS-1	RF shield box	
	Because the WCDMA network disturbs the RX side testing of the WCDMA phone and the Tx signal of the WCDMA phone can severely disturb the WCDMA network, a shield box is needed in all testing, tuning and fault finding which requires WCDMA RF signal.		
	PK-1	Software protection key	
	PK-1 is a hardware protection key with a USB interface. It has the same functionality as the PKD-1 series dongle.		
	RJ-230	Soldering jig	
	RJ-230 is a soldering jig used for soldering and as a rework jig for the engine module.		
	SB-6	Bluetooth test and interface box (sales package)	
	The SB-6 test box is a generic service device used to perform Bluetooth bit error rate (BER) testing, and establishing cordless FBUS connection via Bluetooth. An ACP-8x charger is needed for BER testing and an AXS-4 cable in case of cordless interface usage testing .		
	Sales package includes:		
	<ul style="list-style-type: none"> • SB-6 test box • Installation and warranty information 		

	SB-7	WLAN test box	
	WLAN test requires defined position for the device.		
	SRT-6	Opening tool	
	<p>SRT-6 is used to open phone covers. Note: The SRT-6 is included in the Nokia Standard Toolkit.</p>		
	SS-210	Camera removal tool	
	The camera removal tool SS-210 is used to remove/attach the camera module from/to the socket.		
	SS-93	Opening tool	
	<p>SS-93 is used for opening JAE connectors. Note: The SS-93 is included in Nokia Standard Toolkit.</p>		
	SX-4	Smart card	
	<p>SX-4 is a BB5 security device used to protect critical features in tuning and testing. SX-4 is also needed together with FPS-21 when DCT-4 phones are flashed.</p>		

Cables

The table below gives a short overview of service devices that can be used for testing, error analysis, and repair of product RM-626. For the correct use of the service devices, and the best effort of workbench setup, please refer to various concepts.

 CA-101 100cm	CA-101	Micro USB cable	
The CA-101 is a USB-to-microUSB data cable that allows connections between the PC and the phone.			
	CA-158RS	RF tuning cable	
Product-specific adapter cable for RF tuning.			
	CA-31D	USB cable	
The CA-31D USB cable is used to connect FPS-21 to a PC. It is included in the FPS-21 sales package.			

 CA-89DS 100cm 	CA-89DS	Cable	
Provides VBAT and Flashbus connections to mobile device programming adapters.			
	DAU-9S	MBUS cable	
The MBUS cable DAU-9S has a modular connector and is used, for example, between the PC's serial port and module jigs, flash adapters or docking station adapters. Note: Docking station adapters valid for DCT4 products.			
	PCS-1	Power cable	
The PCS-1 power cable (DC) is used with a docking station, a module jig or a control unit to supply a controlled voltage.			

	XRS-6	RF cable	
<p>The RF cable is used to connect, for example, a module repair jig to the RF measurement equipment.</p> <p>SMA to N-Connector approximately 610 mm.</p> <p>Attenuation for:</p> <ul style="list-style-type: none"> • GSM850/900: 0.3+-0.1 dB • GSM1800/1900: 0.5+-0.1 dB • WCDMA/WLAN: 0.6+-0.1dB

■ IVE troubleshooting

Introduction to IVE troubleshooting

The IVE engine is a next generation imaging and video engine based on BCM2727B. The BCM2727B acts as imaging, video, display, and HDTV and SDTV hardware accelerator.

The following references on the PWB help in the effective debugging and troubleshooting of IVE.

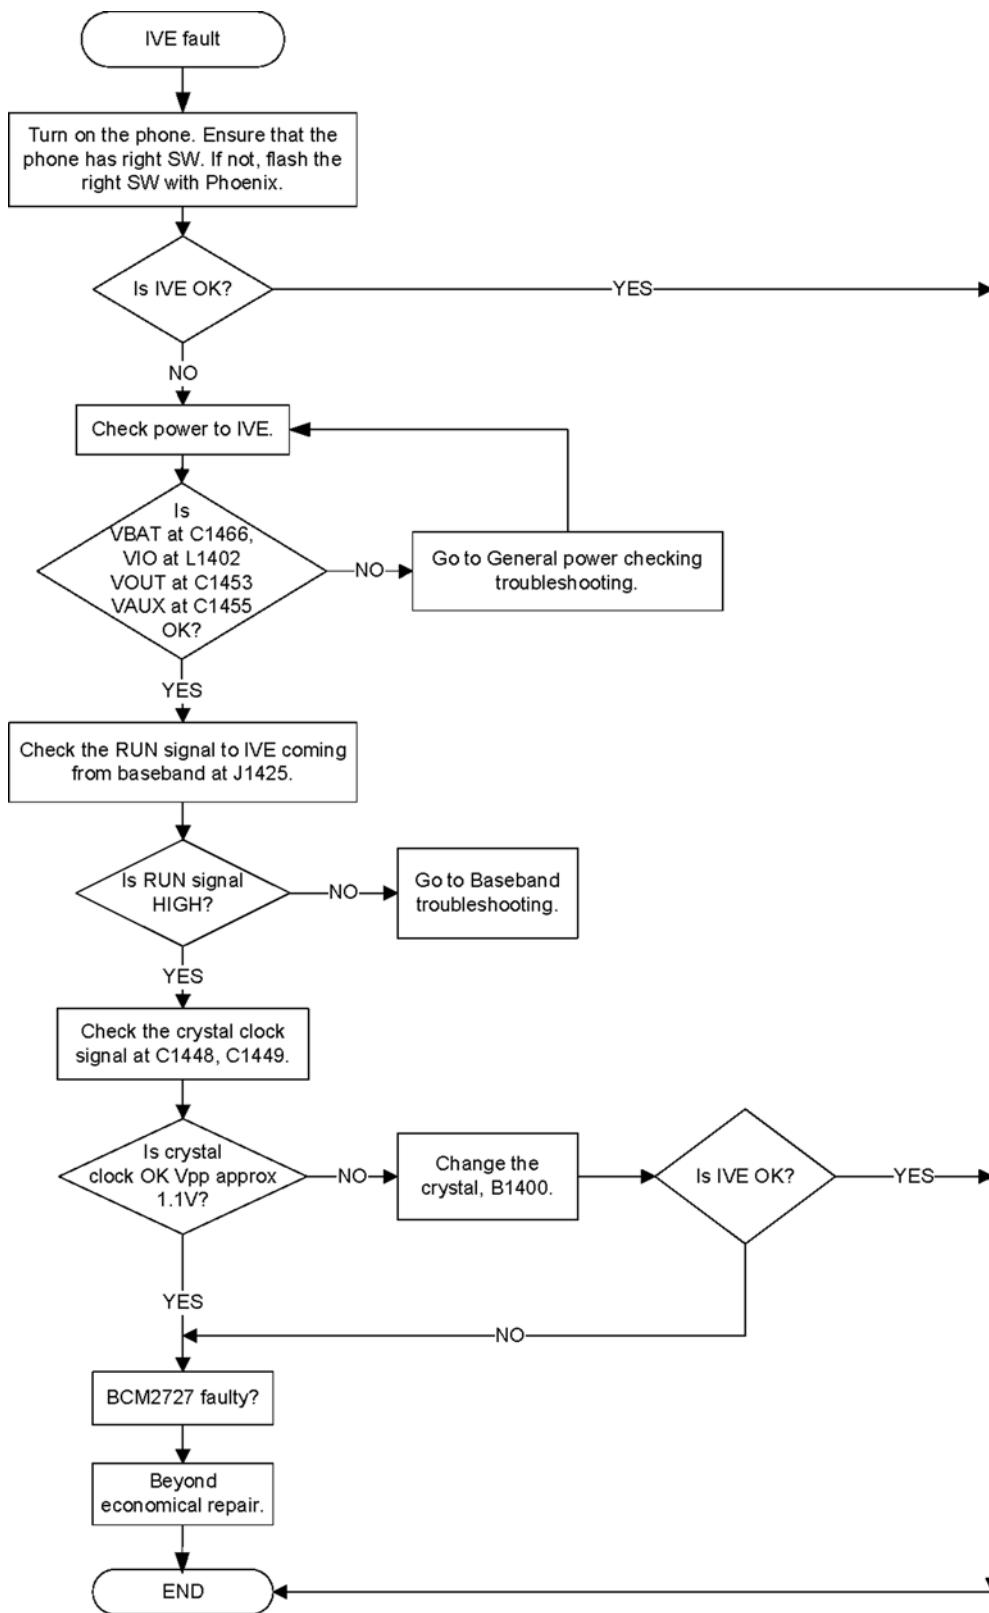

Sr. No	Reference	Description
1	B1400	19.2MHz Crystal
2	D1400	IVE/BCM2727B IC

The following test points on the PWB help in the effective debugging and troubleshooting.

Sr. No	Signal name	Measuring point	Description
1	VIVE_2V5_FILT	L1403/C1453	2.5V supply to BCM2727B
2	VIVE_2V8_FILT	L1404/C1455	2.8V supply to BCM2727B
3	VIVE_1V8_FILT	L1402	1.8V supply to BCM2727B
4	VBAT	L1403/C1466	VBAT supply to BCM2727B
5	RUN	J1425	Enable signal to IVE. This needs to be High for IVE to be Up.
6	XIN	C1448	19.2MHz clock to IVE

IVE troubleshooting

Troubleshooting flow

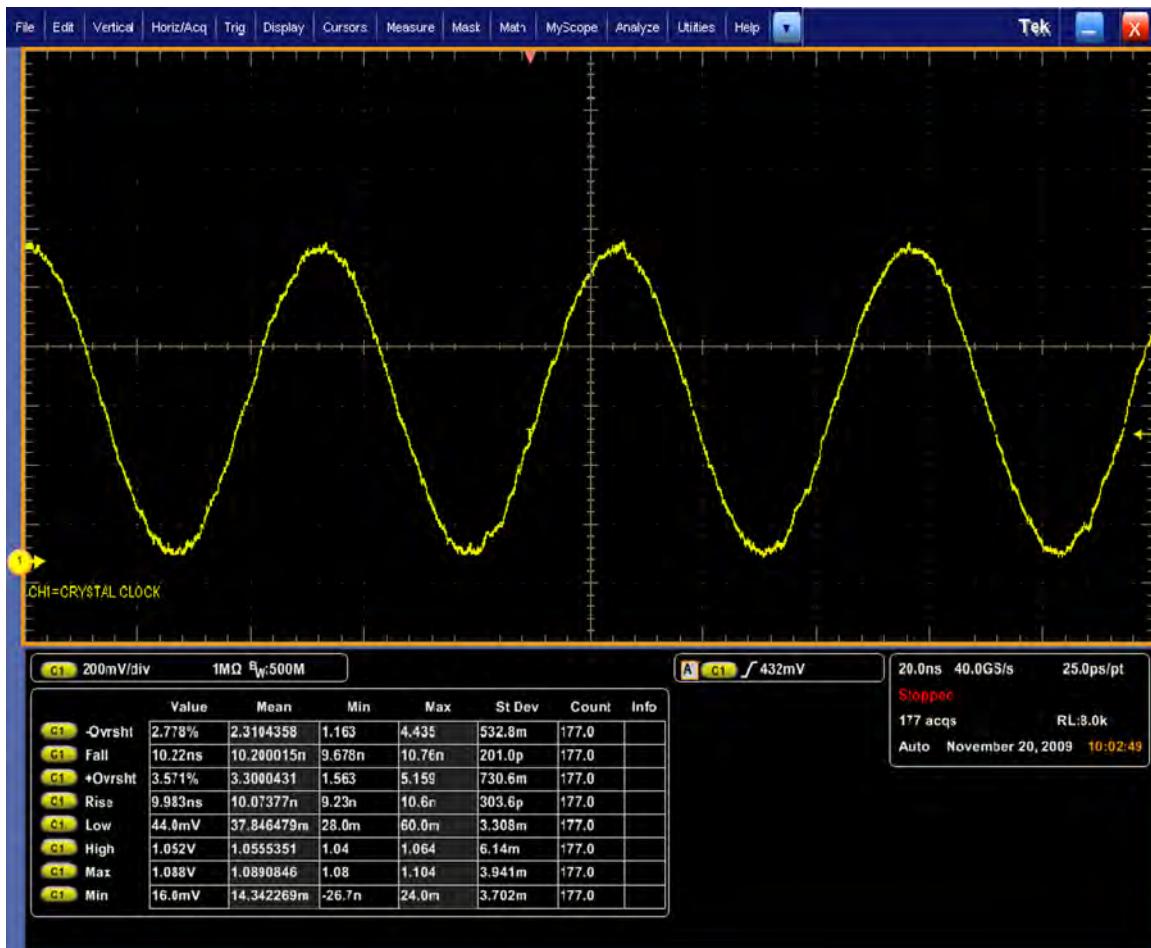

Figure 8 Expected Crystal clock input to BCM2727B on Oscilloscope

■ TV out troubleshooting

Introduction to HDTV and SDTV troubleshooting

HDTV

The phone has HDTV capability. The phone can be connected to an HDTV through a Type A to Type C HDMI cable.

The following references on the PWB help in the effective debugging and troubleshooting of HDTV Out.

Sr. No	Reference	Description
1	X1650	HDMI connector
2	N1653	HDMI connector ASIP on HDMI bus
3	N1654	HDMI bus ASIP on control bus
4	Z1650 to Z1653	Common mode choke on HDMI bus
5	N1651	HDMI 5V regulator
6	D1400	BCM2727B IC
7	D1653	HPD signal buffer
8	V1657	HDMI +5V ESD protection

The following test points on the PWB help in the effective debugging and troubleshooting.

Sr No	Signal name	Measuring point	Description
1	HDMI_REG_EN	R1672	Enable signal for VHDMI_5V0 regulator. This signal needs to be High for regulator to be On.
2	VHDMI_5V0	V1656	5V supply to HDMI sink.
3	HDMI_CABLE_DET	SW1.X1650	HDMI cable detect signal to HDMI source. This signal goes Low when a cable is inserted.
4	HDMI_HPD	19.X1650	Hot Plug Detect signal to HDMI source. This signal goes High when a cable is inserted.
5	HDMI_I2C(1:0)	15.X1650 16.X1650	I2C signals for HDMI.

SDTV

The phone has SDTV capability. The phone can be connected to an analog TV through a TV Out cable.

The following references on the PWB help in the effective debugging and troubleshooting of SDTV Out.

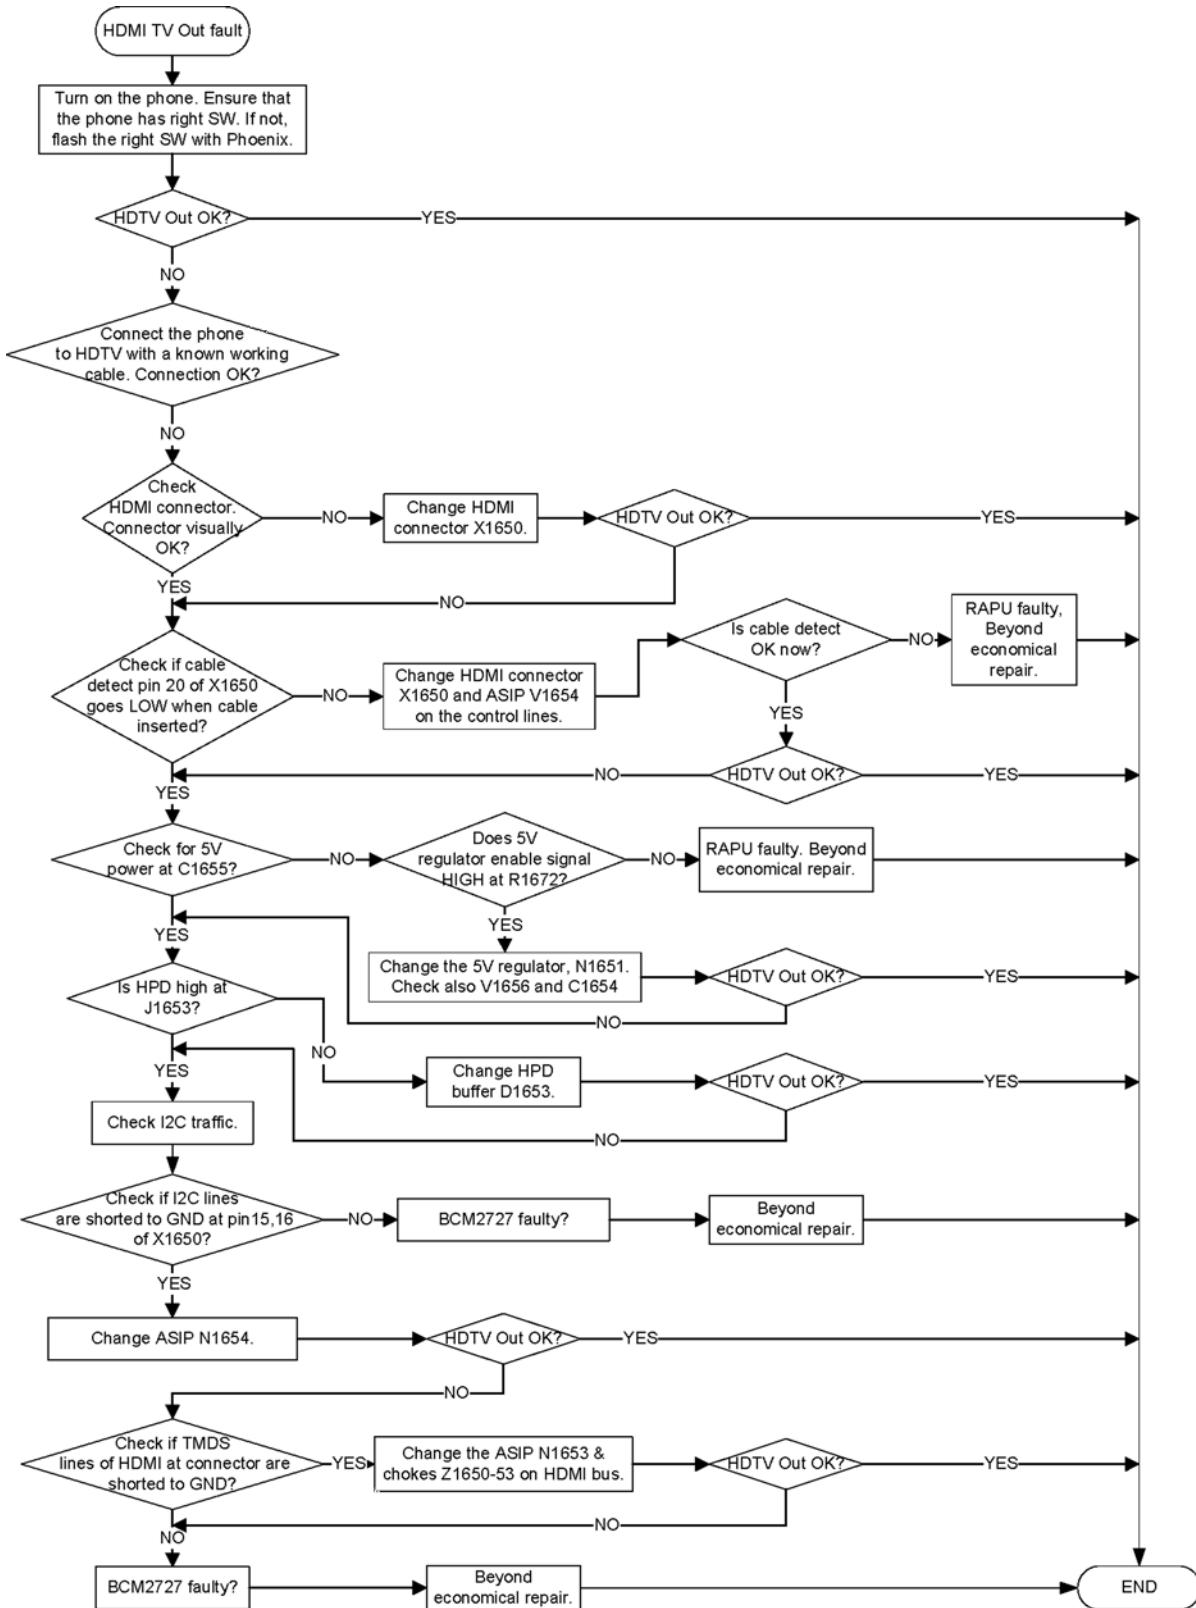

Sr. No	Reference	Description
1	R1419	DAC termination resistor. Resistor value 15 OHMS.
2	D1400	BCM2727B IC
3	N2001	Analog switch
4	L2001	Ferrite bead on the CVBS signal
5	X2001	AV connector

The following test points on the PWB help in the effective debugging and troubleshooting.

Sr No	Signal name	Measuring point	Description
1	CVBS	X2001.1/J2002	SDTV signal

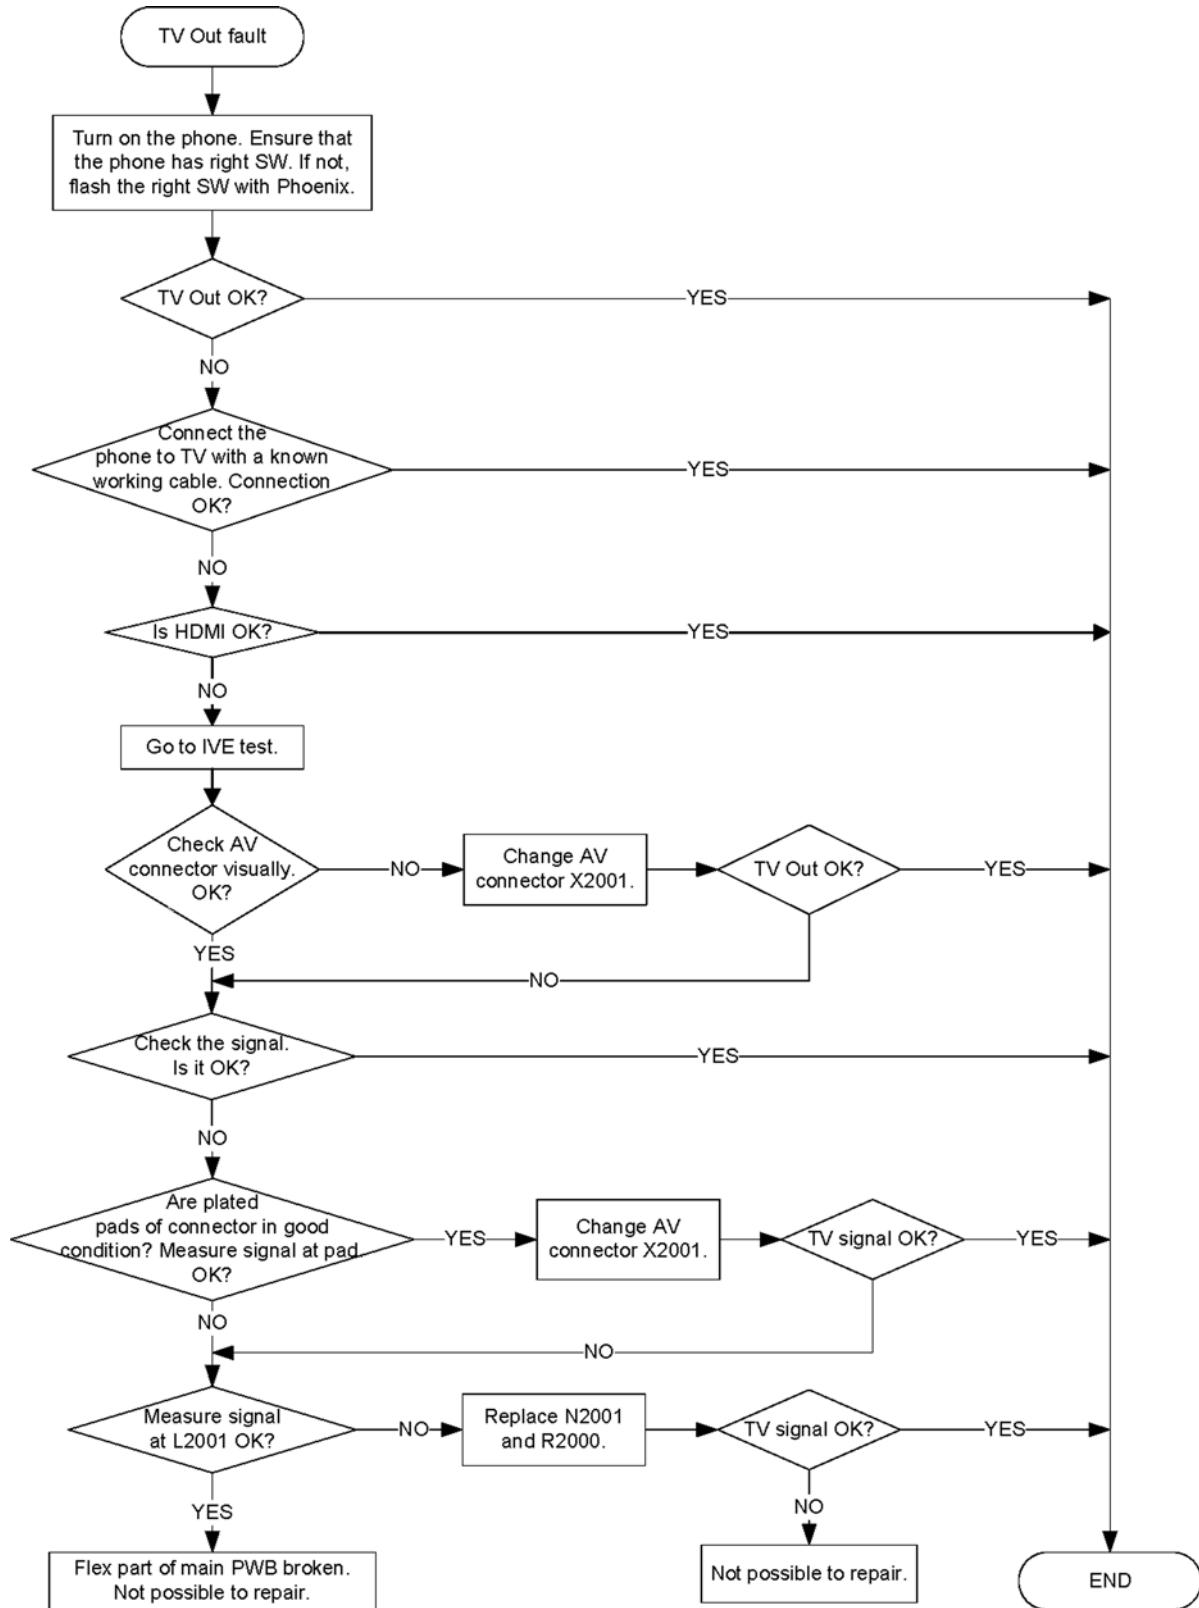

HDTV out troubleshooting

Troubleshooting flow

SDTV out troubleshooting

Troubleshooting flow

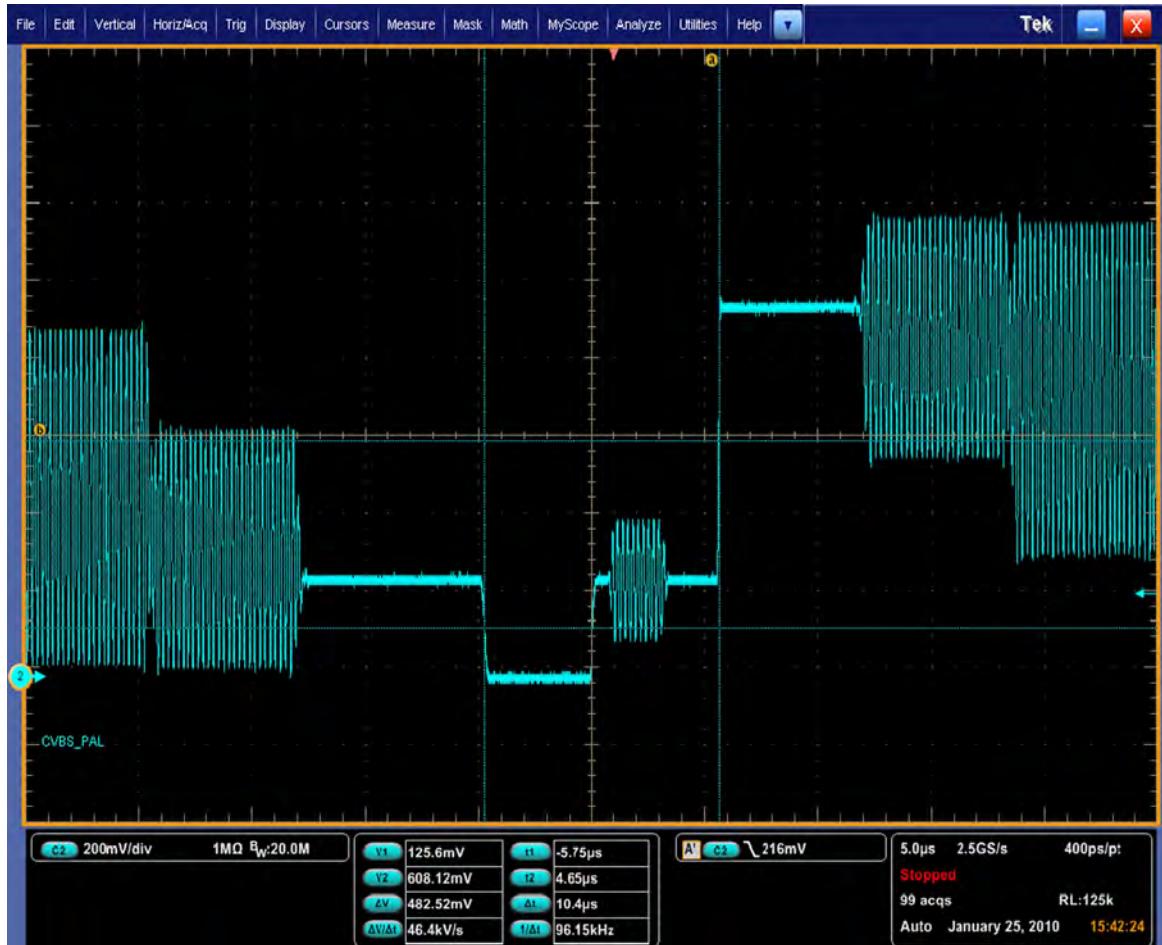

Figure 9 Expected SDTV CVBS PAL signal on Oscilloscope

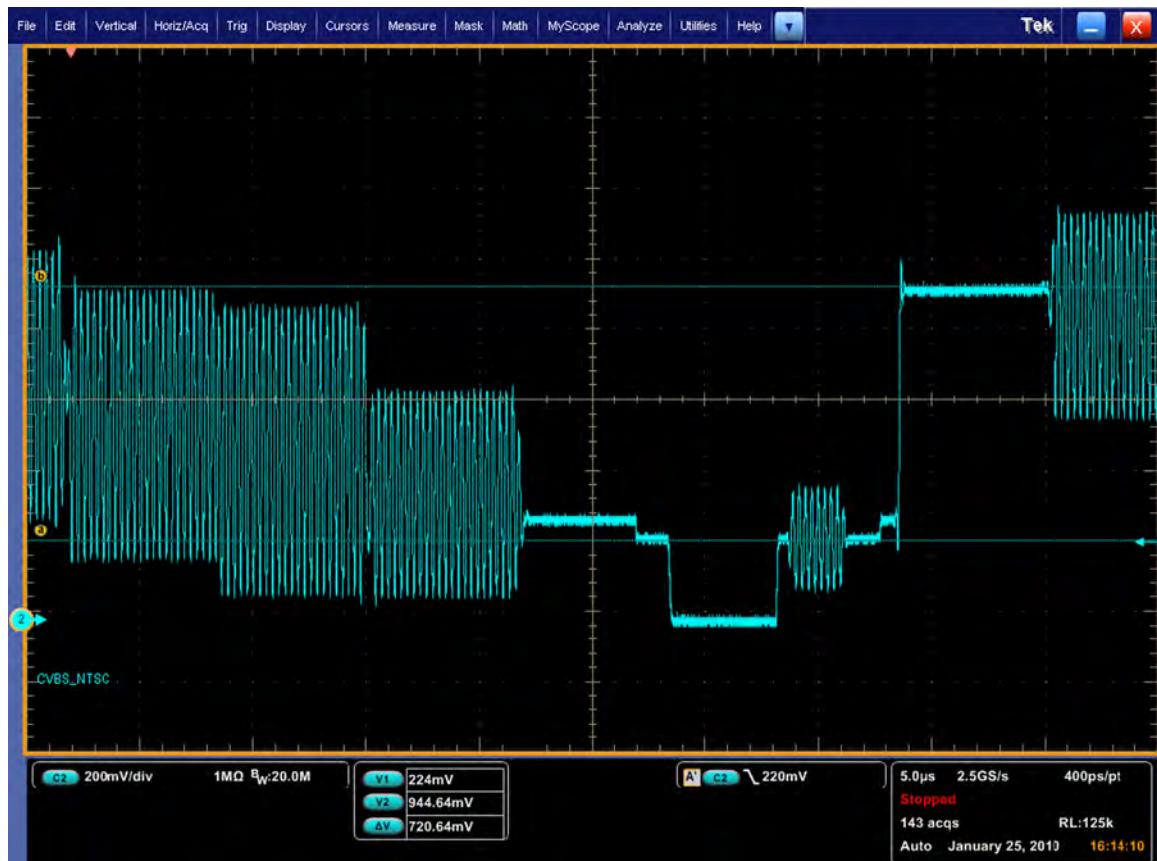

Figure 10 Expected SDTV CVBS NTSC signal on Oscilloscope

■ Display module troubleshooting

General instructions for display troubleshooting

The first step is to verify with a working display that the fault is not on the display module itself. The display module cannot be repaired.

The second step is to check that the engine is working normally. This can be done by connecting the phone to a docking station and starting Phoenix service software. With the help of Phoenix read the phone information to check that also the application engine is functioning normally (you should be able to read the APE ID).

After these checks proceed to the display troubleshooting flowcharts. Use the Display Test tool in Phoenix to find the detailed fault mode.

Pixel defects

Table 6 Display module troubleshooting cases

Display blank	There is no image on the display. The display looks the same when the phone is on as it does when the phone is off.
Image on the display not correct	Image on the display can be corrupted or a part of the image can be missing. If a part of the image is missing, change the display module. If the image is otherwise corrupted, follow the appropriate troubleshooting diagram.

Visual defects (pixel)	Pixel defects can be checked by controlling the display with Phoenix. Use both colors, black and white, on a full screen. R, G, B are also helpful. The display may have some random pixel defects that are acceptable for this type of display. The criteria when pixel defects are regarded as a display failure, resulting in a replacement of the display, are presented in the following table.
------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Table 7 Pixel defects

Bright sub-pixels	(sometimes called on-pixels or stuck-on) are characterized by the appearance of bright/colored pixels in, for example, black full screen picture.
Dark sub-pixels	(sometimes called off-pixels, stuck-off, or black pixels) are characterized by the appearance of dark pixels in white, red, green, or blue full-screen picture.
Combined sub-pixel	defects are characterized by at least two sub-pixels defects (bright or dim) being closer than 5 mm to each other.
Temporal sub-pixels	(sometimes called blinking defects) exhibit temporal variations not related to any steady-state video input. Temporal sub-pixel defects may be intermittent, exhibit a sudden change of state, or be flickering.

Table 8 Defects table

Item		Bright dot (sub-pixel) defect	Dark dot (sub-pixel) defect	Total
1	Defect counts	Not allowed		
2	Combined sub-pixel defect	Not allowed		
3	Temporal sub-pixel defect	Not allowed		

Note: Blinking pixels are not allowed in normal operating temperatures and light conditions.

Introduction to display troubleshooting

The display module used is based on AM OLED technology and supports display format of 360 columns x 640 rows. The dimension of the display module is 53.76 mm x 97.16 mm x 2.21 mm. The module will interface to the phone via FPC with a 20 pins board to board connector.

The following references on the PWB help in the effective debugging and troubleshooting of the display.

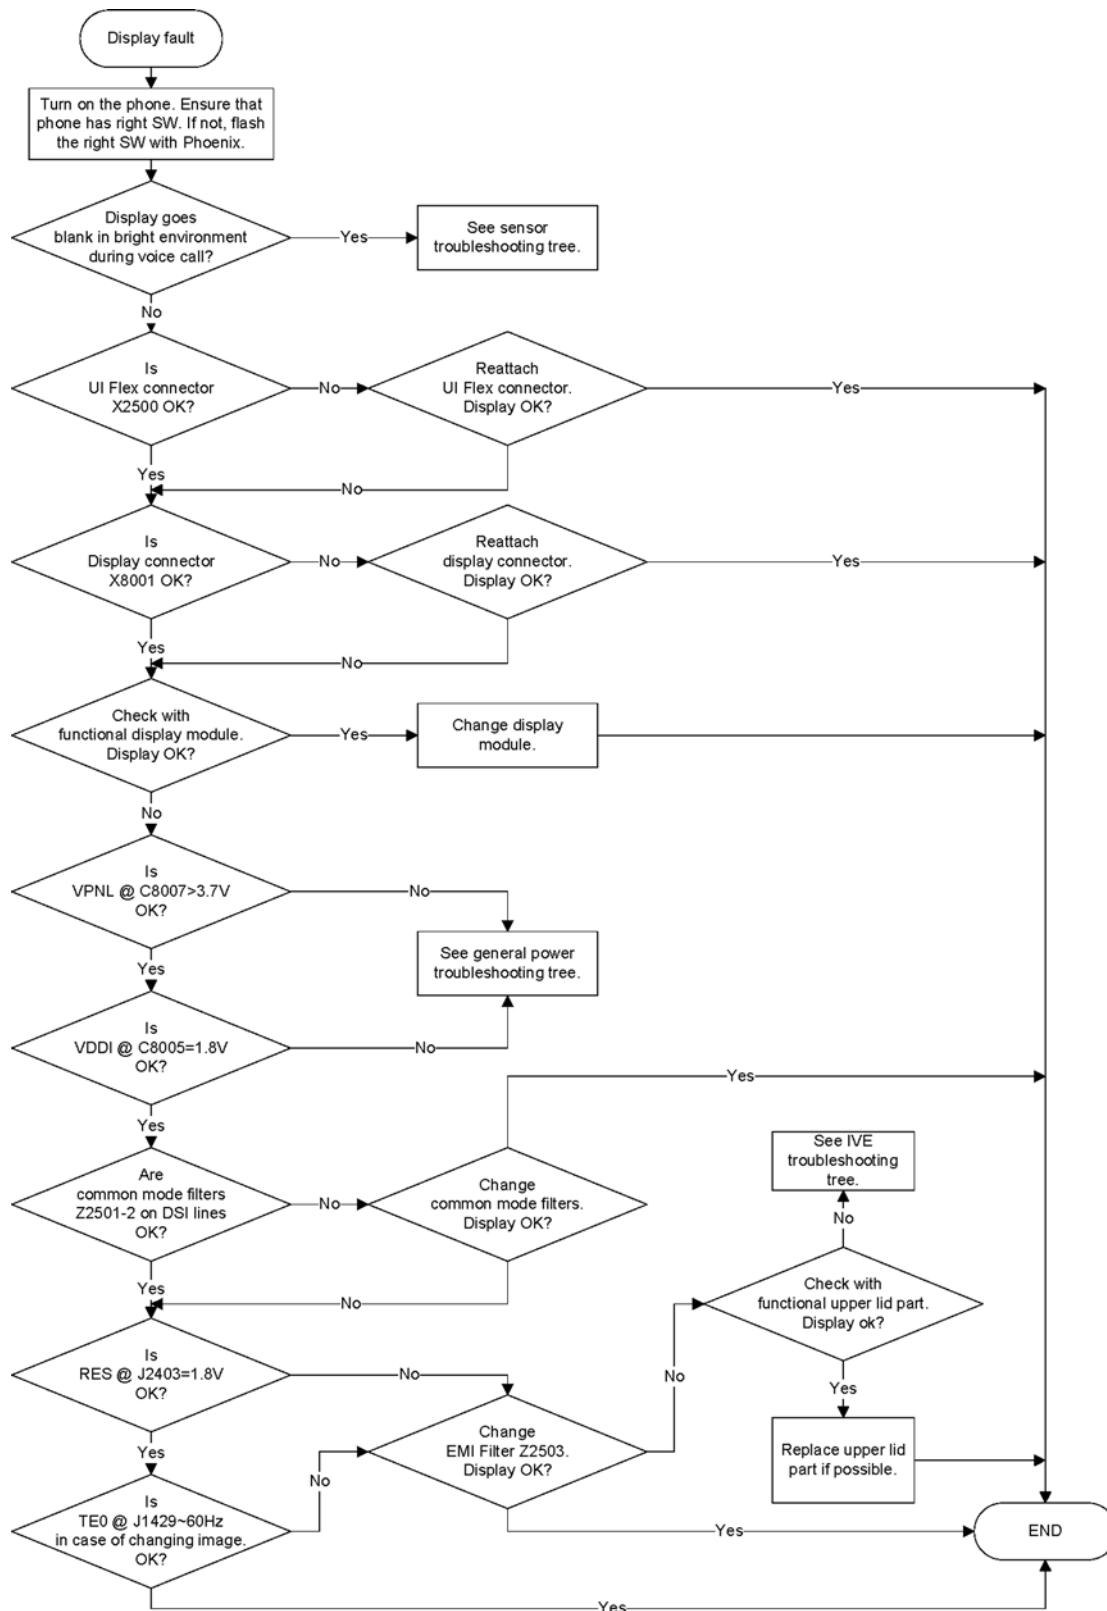

Sr No	Reference	Description
1	X8001	Display connector
2	Z2501, Z2502	Common Mode Choke on DSI bus
3	J2403	Test point on display Reset line. Reset signal needs to be High for the display to be Up.
4	D1400	BCM2727B IC

The following test points on the PWB help in the effective debugging and troubleshooting.

Sr. No	Signal name	Measuring point	Description
1	VIO	L8002/C8005	1.8V supply to display
2	VBAT	L8003/C8007	VBAT supply to display
3	TE0	J1429	Tearing effect signal from display module.

Magnetometer troubleshooting

Equipment

- Non-magnetic, horizontal table
 - nearest ferromagnetic part, distance more than 50 cm
- Traditional needle type compass for reference
- Rotating platform (sheet of wood or plastic)
- PC with Phoenix

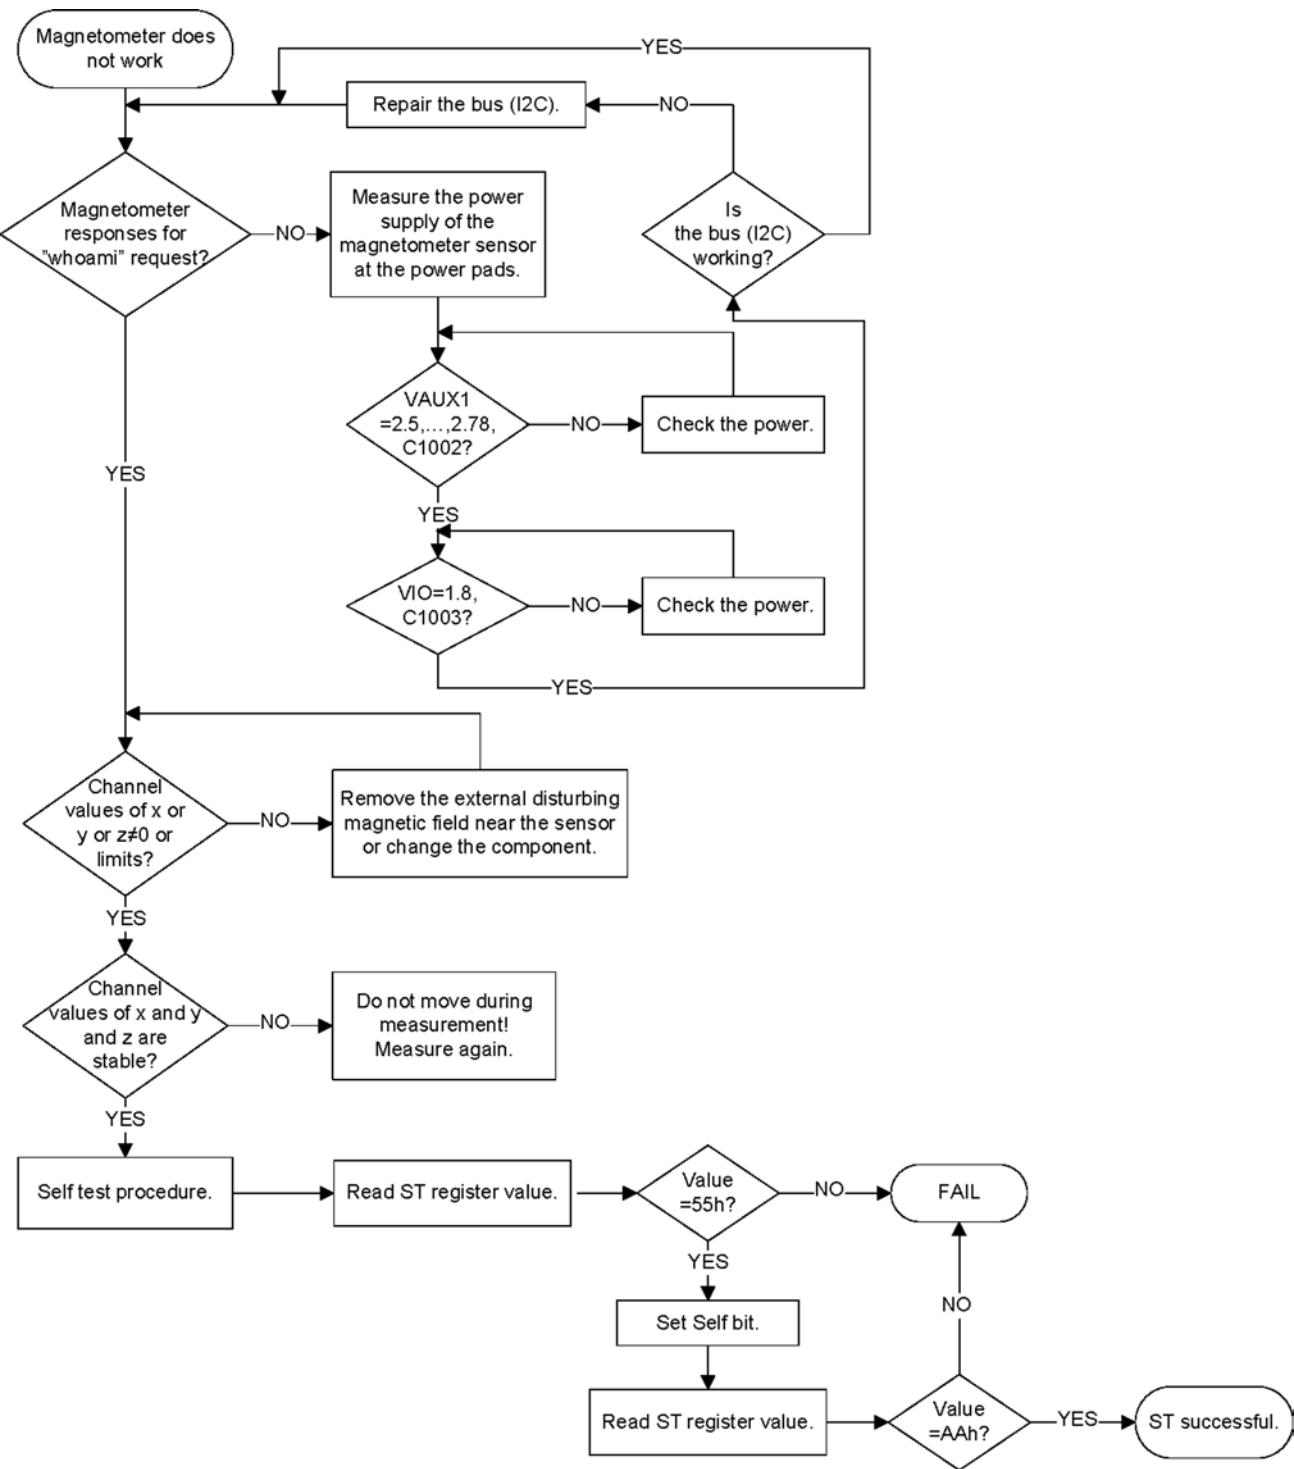

Preparation of phone

- Set the rotating platform to the table
- Set the phone and reference compass to the rotating platform
- Connect the phone to the PC and start Phoenix

Tests

- General troubleshooting test
- Self-test (ST)
- Azimuth check test

Magnetometer general troubleshooting flow

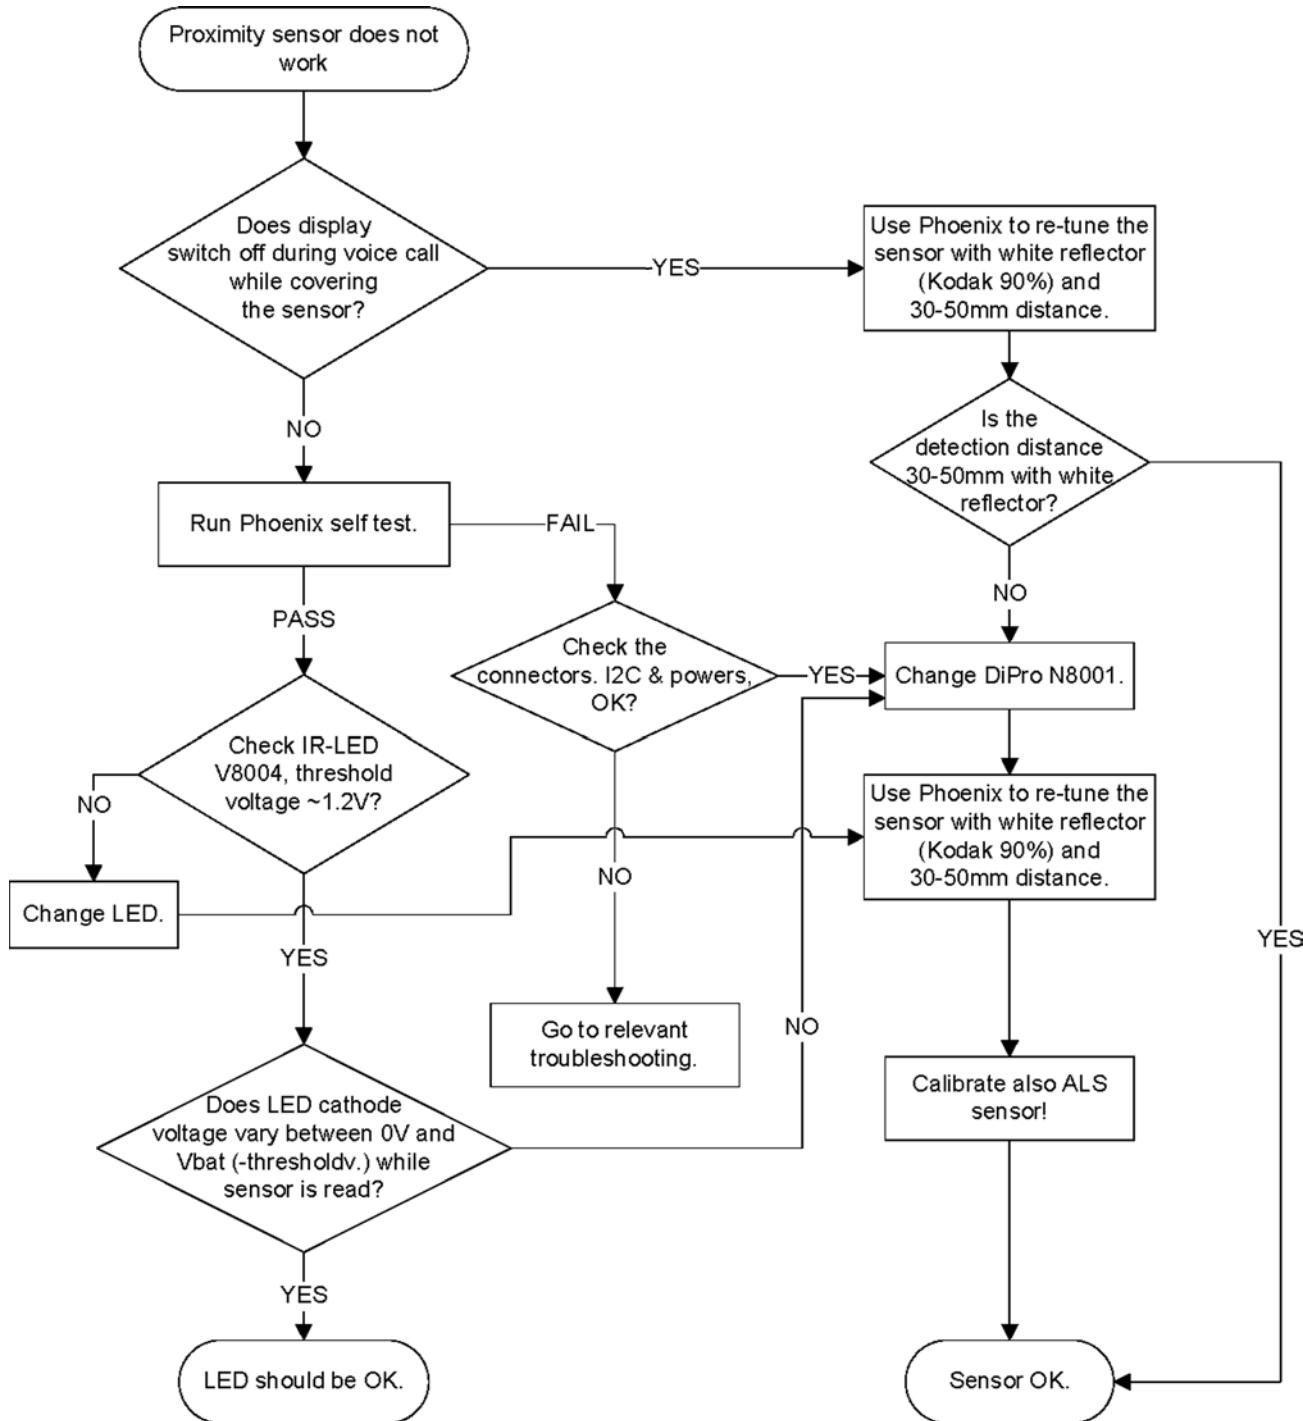

Azimuth check

- Search magnetically quiet place for the test table
 - No disturbing elements near the table, such as motors, coils, electric currents or similar
- Calibrate the phone as described in the user manual
 - The indicator must be GREEN

- Rotate the platform manually one round on the horizontal table with steps of approximately 15° degrees
 - The reference angle direction value from the reference compass = REF(angle)
 - Read the phone value = ACT(angle)
- Calculate for every step (24 steps)
 - Result(angle) = REF(angle) - ACT(angle)
 - The result is the real angle difference of angles in a 360° degrees continuous round
- Criteria:
 - If the Result(angle) value < 15° degrees GO, otherwise NOGO

Proximity sensor troubleshooting

Troubleshooting flow

ALS technical description and troubleshooting

Proximity sensor and ambient light sensor (ALS)

This phone uses a combined proximity and ambient light sensor called DiPro. The proximity part of the device uses an external IR LED supplied by VBAT. The current this LED consumes is controlled by DiPro and set using software. The interrupt output of DiPro changes state when the infra red light from the LED is reflected back by a suitable reflective surface.

Note that when proximity is in use, during a voice call, the proximity sensor detects face and turns off the display and touch to prevent false key pressing.

The ambient light sensor detects the level of ambient light and adjusts the display and key brightness accordingly whenever the display is active. Covering this sensor results in dimmed display and key lights.

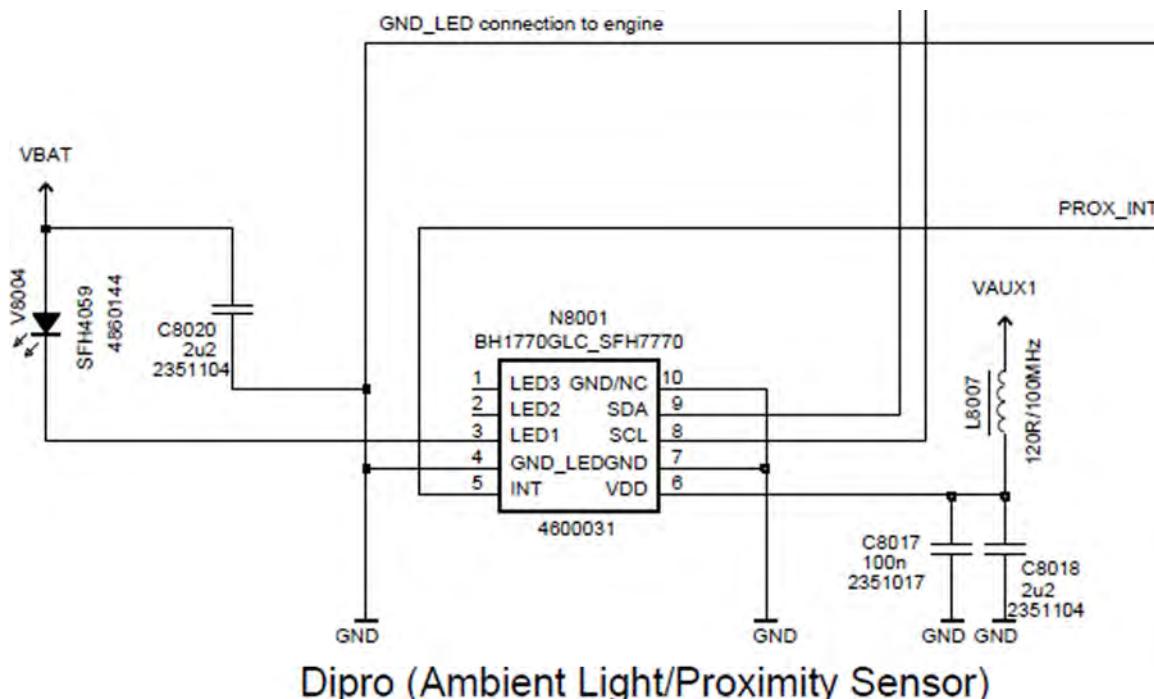

Figure 11 DiPro proximity sensor and ambient light sensor

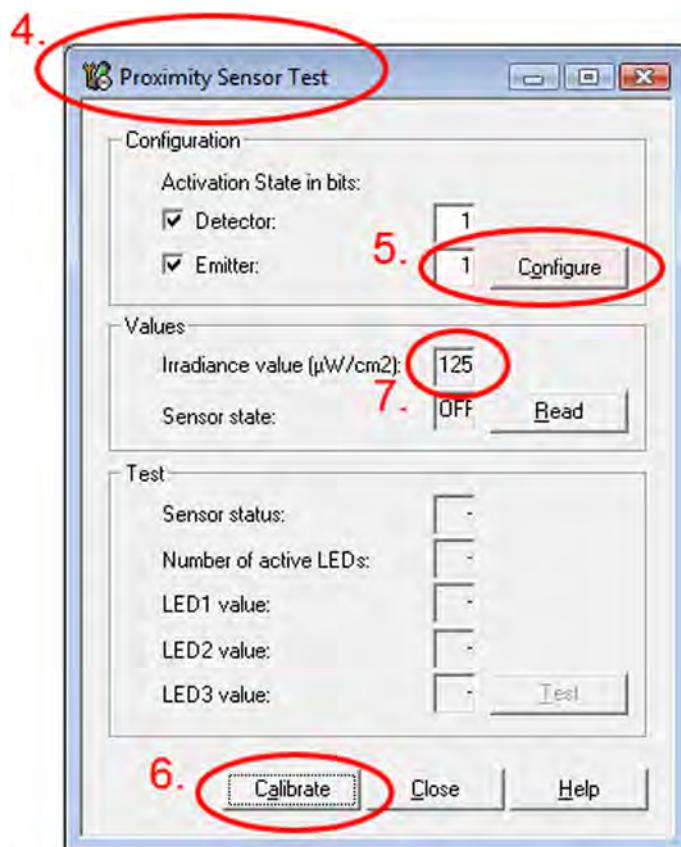

Proximity tuning

Prerequisites

Note: Tuning should be done only if the sensor/chassis is changed!

Steps

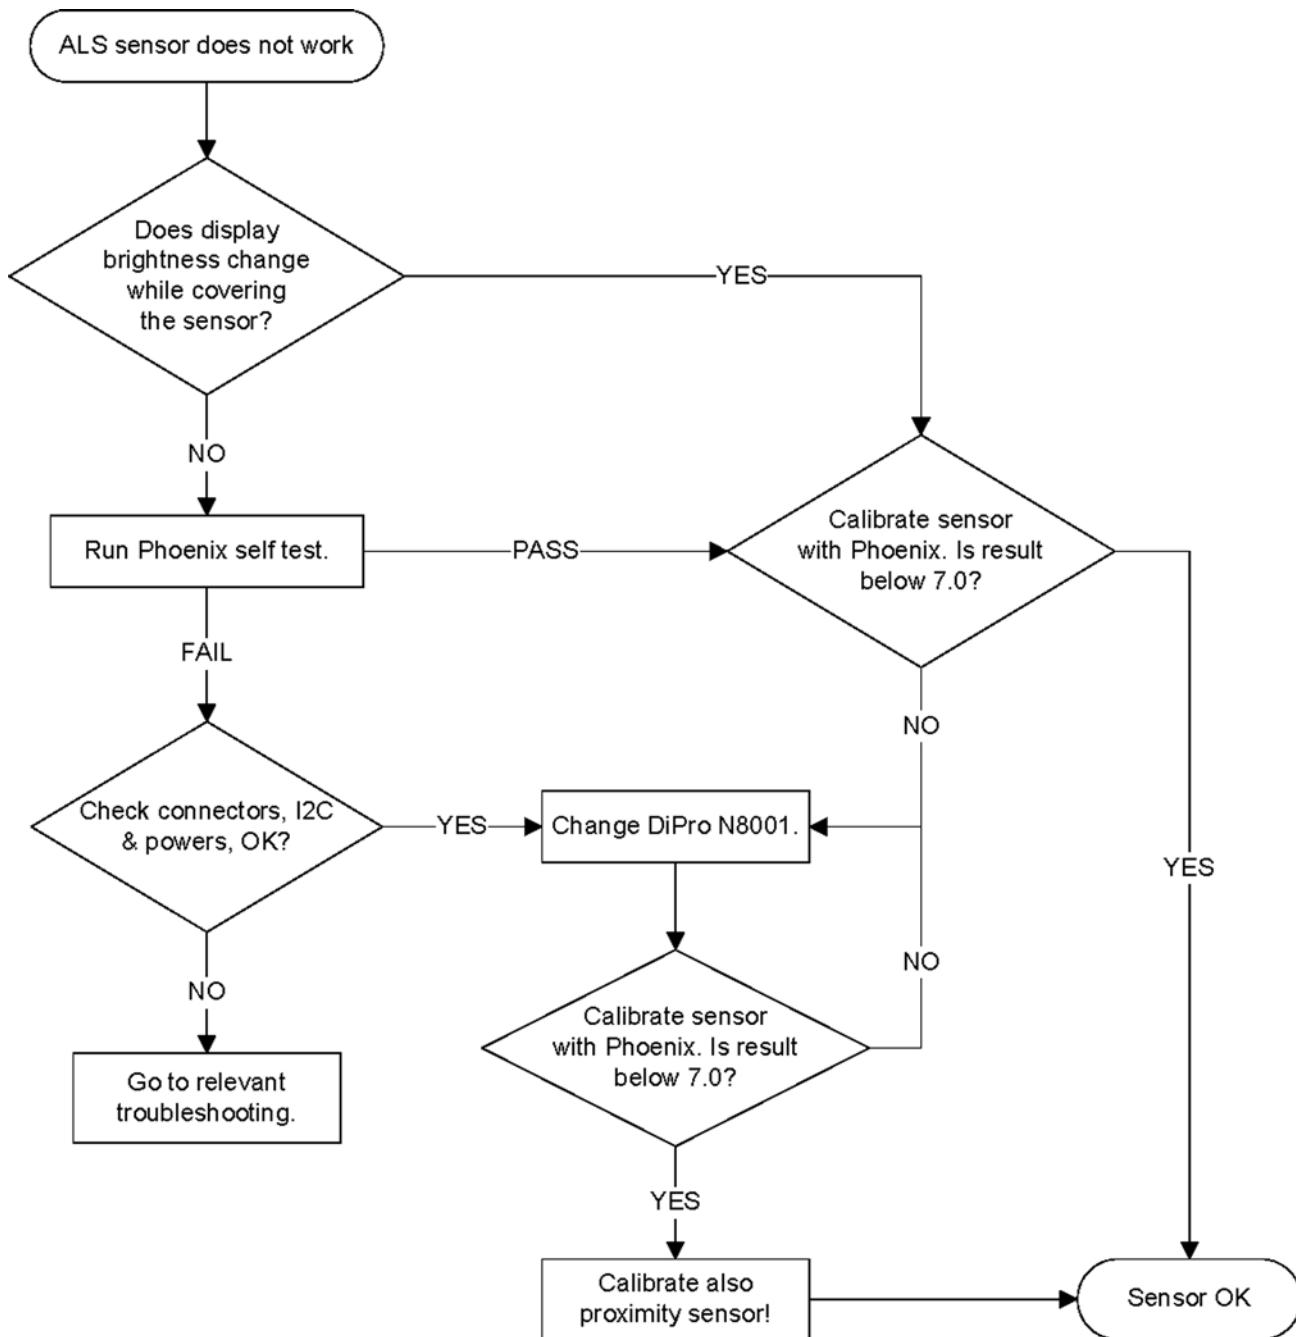

1. Place the phone to the calibration jig.
2. Make sure that the Kodak90% reflector is 50 mm above the proximity sensor.
3. Set the phone to **Local mode** with Phoenix.

4. Select Phoenix Proximity Sensor Test.

5. Set the **Emitter** value to 1 and click **Configure**.
6. Click **Calibrate**.
7. If the **Irradiance value** is >100, the result is PASS. Skip Step 8.
8. If the **Irradiance value** is <100, the result is FAIL. Lower the reflector (min. 30 mm) and repeat Step 6. until the value is 100-105.
9. The proximity sensor is tuned.

ALS troubleshooting

Troubleshooting flow

■ Audio troubleshooting

Audio troubleshooting test instructions

Single-ended external earpiece and differential internal earpiece outputs can be measured either with a single-ended or a differential probe.

When measuring with a single-ended probe each output is measured against the ground.

Internal handsfree output is measured using a current probe, if a special low-pass filter designed for measuring a digital amplifier is not available. Note also that when using a current probe, the input signal frequency must be set to 2 kHz.

The input signal for each loop test can be either single-ended or differential. Exception to this is a digital microphone which needs input signal from an external sound source (laptop speaker) to playback, eg. 1 kHz sine wave from 5 cm distance.

Required equipment

The following equipment is needed for the tests:

- Oscilloscope
- Function generator (sine waveform)
- Current probe (Internal handsfree DPMA output measurement)
- Phoenix service software
- Battery voltage 3.7V
- Sound source (laptop speaker or B&K type 4231 calibrator)

Test procedure

Audio can be tested using the Phoenix audio routings option. Three different audio loop paths can be activated:

- External headset mic to earpiece
- External headset mic to IHF mono
- Internal digital microphone to headset

Each audio loop sets routing from the specified input to the specified output enabling a quick in-out test. Loop path gains are fixed and they cannot be changed using Phoenix. Correct pins and signals for each test are presented in the following table.

Phoenix audio loop tests and test results

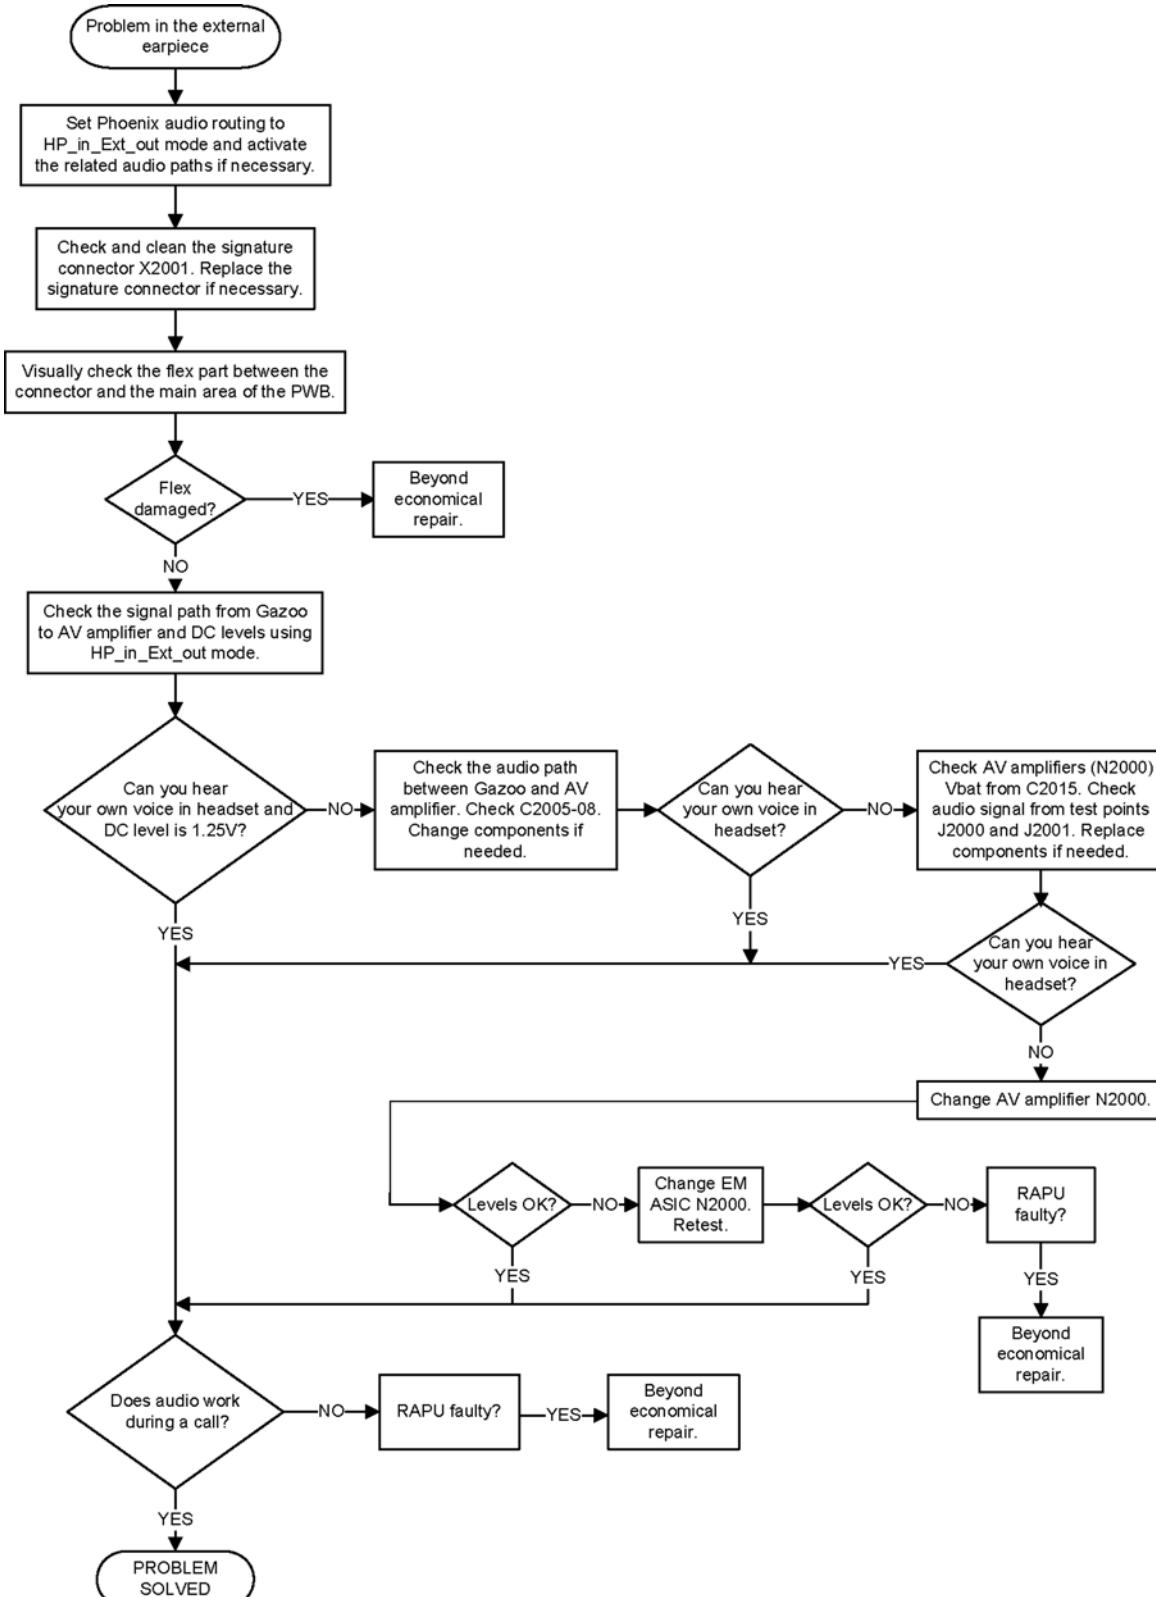

The results presented in the table apply when no accessory is connected and battery voltage is set to 3.7V. Earpiece, internal microphone and speaker are in place during measurement. Applying a headset accessory during measurement causes a significant drop in measured quantities.

The gain values presented in the table apply for a differential output vs. single-ended/differential input.

Loop test	Input terminal	Output terminal	Path gain [dB] (fixed)	Input voltage [mVp-p]	Output DC level [V]	Output voltage [mVp-p]
External headset mic to earpiece	HS_MIC & GND	EAR 1 & GND	0	300	1.35	300
		EAR 0 & GND				
External headset mic to IHF mono	HS_MIC & GND	L2158 & L2159	10	200		630
Internal digital microphone to headset	Acoustical Input, 1kHz sine wave	HS_L & GND	NA	94 dB SPL		70
		HS_R & GND

■ Connectivity module troubleshooting

Introduction to connectivity module troubleshooting

The BOB1.0M-b module supports WLAN, BT and FMRX. From a troubleshooting point of view, WLAN is tested separately, but BT and FMRX are checked in parallel.

REFOUT_EXT1 single ended 38.4 MHz analog clock from Linko RF is provided to BOB1.0M-b. The clock request for the reference clock in the BOB1.0M-b module is shared between WLAN and BT blocks. When either system requires a clock, this signal will be active. The CLK_REQ is connected to ExtSysClkReq pin of RAPU. The SLEEPCLK input of 32.768 KHz clock from EM ASIC is used for power management and for FM in low power mode. The internal SMPS supplies the whole BOB1.0M-b solution from the phone battery supply, VBAT, apart from VIO which is needed for interface signal reference levels.

The following figure shows a top level block diagram of the BOB1.0M-b module.

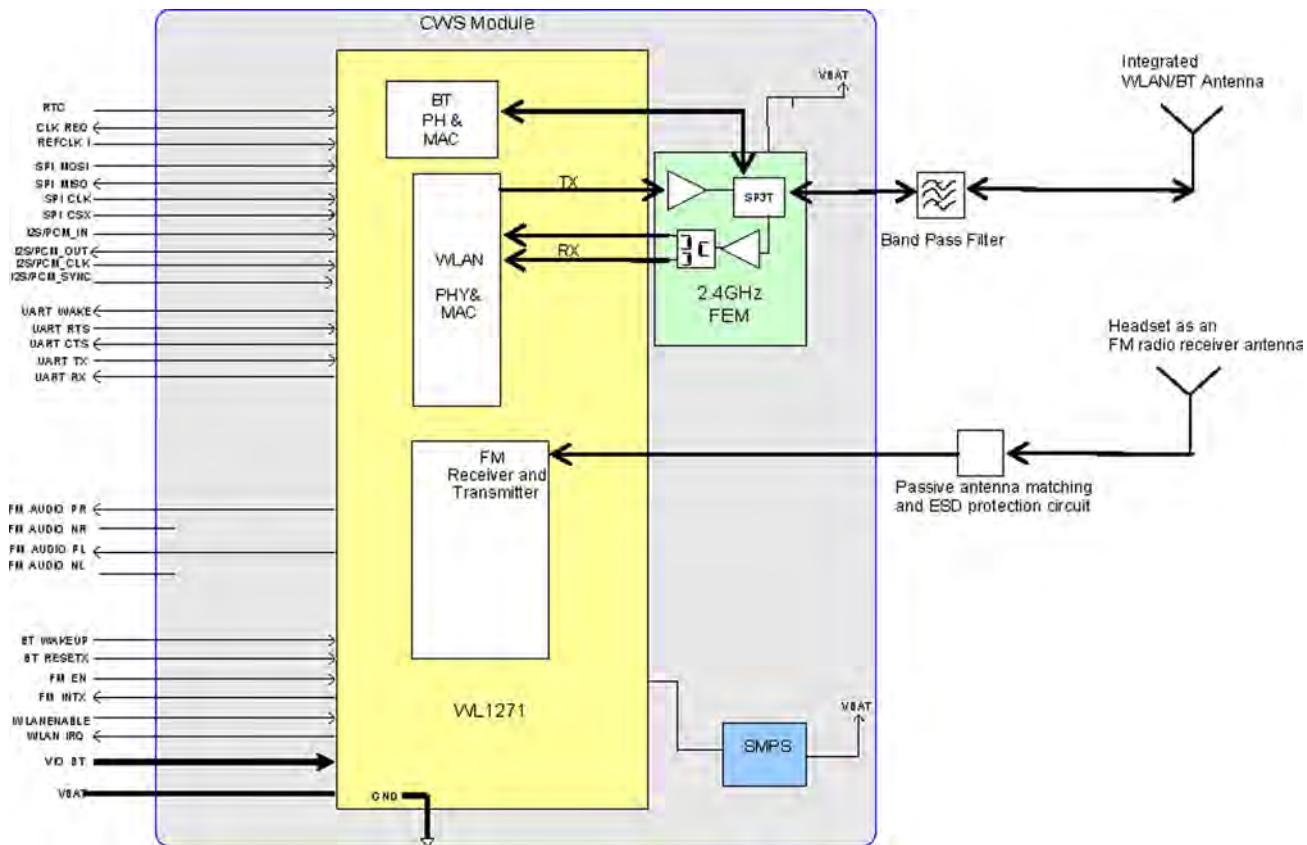

Figure 12 Hardware connections between BB and BOB1.0M-b

Bluetooth/WLAN antenna

The Bluetooth/WLAN antenna is product specific (the antenna is integrated into the PWB frame under the phone's top cap). Bluetooth/WLAN signal is routed through filter and a shared Bluetooth/WLAN antenna is used. The FM receiver RF signal is routed through a product specific FM antenna matching circuit to the phone headset connector. The FM radio audio signal is routed to the headset connector through the BB ASIC shared by the phone audio functions.

The antenna positions are presented in the following figure.

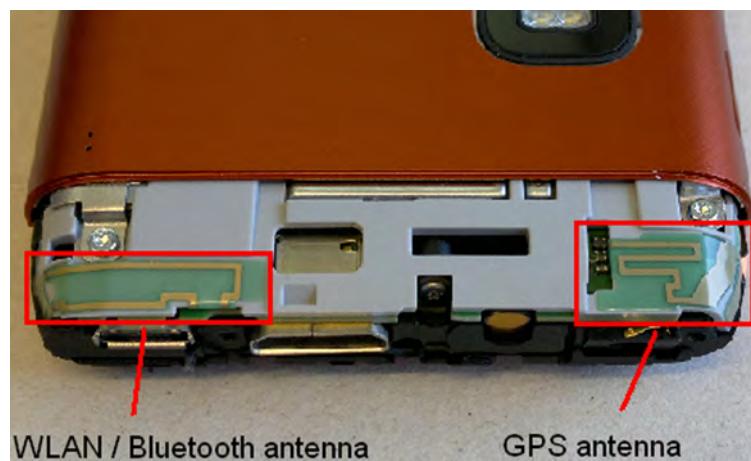

Figure 13 WLAN/Bluetooth and GPS antennas

Component layout and test points of the connectivity module

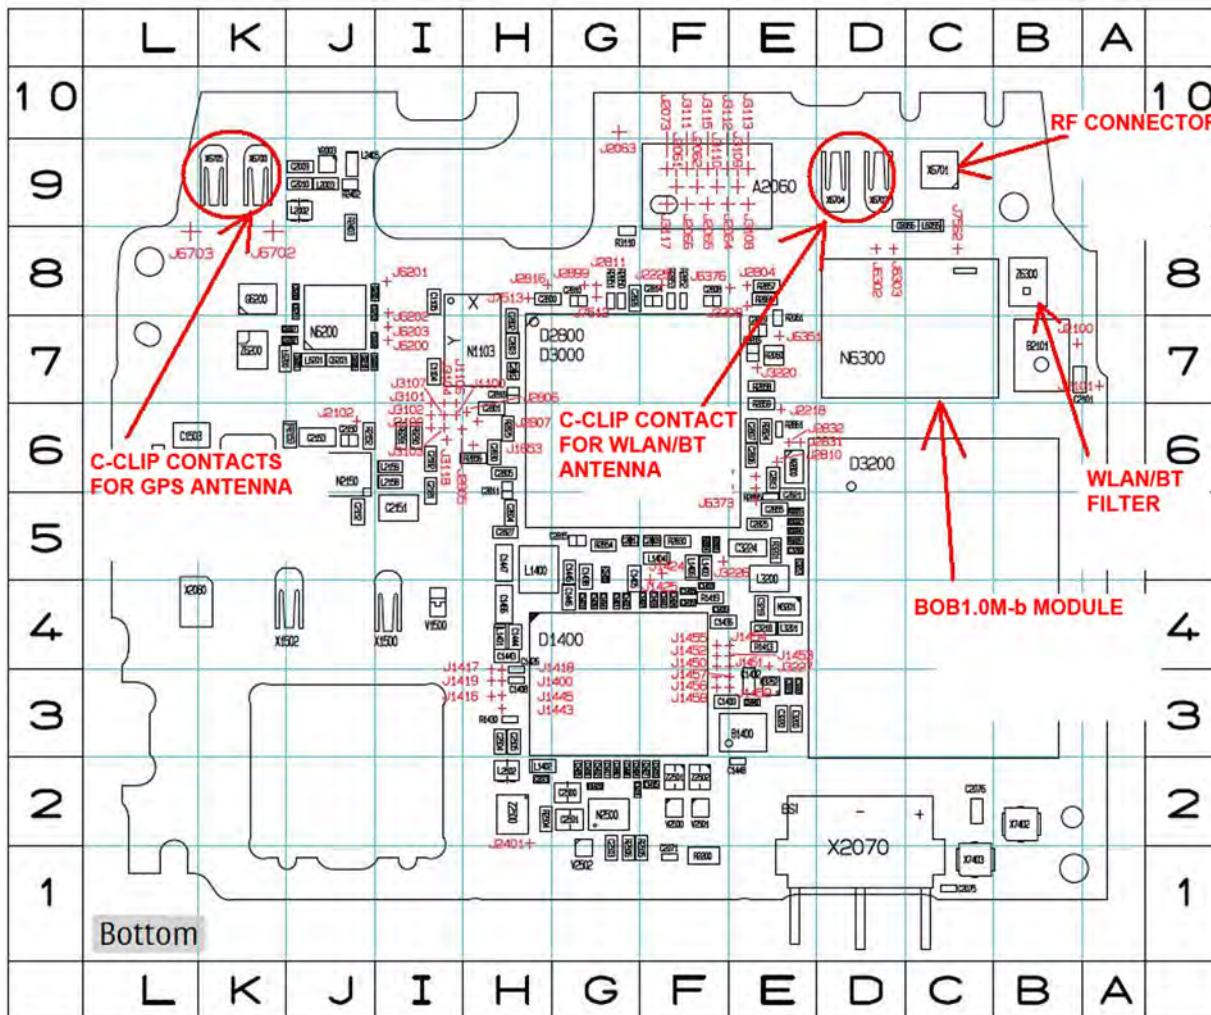

Figure 14 Connectivity module's component layout, bottom side

Bluetooth/FM radio and WLAN troubleshooting

Introduction to Bluetooth/FM radio troubleshooting

The Bluetooth and FM radio receiver functions are combined so these features are checked when troubleshooting.

The following problems can occur with the Bluetooth and FM radio hardware:

Symptom	Problem	Repair solution
Unable to switch on Bluetooth on phone user interface	Open circuit solder joints or component failure of BOB module or SMD components	Replacement of BOB module
Able to send data file to another Bluetooth device, but unable to hear audio through functional Bluetooth headset	Open circuit solder joints or component failure of BOB module (PCM interface)	Replacement of BOB module

Symptom	Problem	Repair solution
Able to switch on Bluetooth on phone user interface, but unable to detect other Bluetooth devices	Open circuit solder joints or detached component in Bluetooth antenna circuit	Repair of Bluetooth antenna circuit
Problems connecting to specific manufacturer/model Bluetooth accessory (specific Bluetooth profile supported by phone and accessory in product specification)	Possible interoperability issue with accessory fixed in recent Nokia phone software release (check Nokia Service Bulletin for the latest information)	Update phone software to the latest version if advised in Nokia Service Bulletin Note: The phone Bluetooth Address and software version are displayed by pressing *#2820# when Bluetooth is on.
Able to turn on FM radio and Bluetooth on phone user interface, but unable to detect local FM radio stations with FM headset inserted	Open circuit solder joints or detached component in FM antenna circuit	Repair of FM receiver antenna circuit
Able to perform scans to detect local FM radio stations with functional FM headset inserted, but unable to hear FM audio through headset	Open circuit solder joints or detached component in FM receiver audio path between Bluetooth/FM ASIC and headset	Repair of FM audio circuit

Users may experience the following problems resulting in functional phones being returned to the repair centre:

Symptom	Problem	Repair solution
Bluetooth feature does not operate as desired with another Bluetooth device	Bluetooth Profile implemented in Bluetooth accessory not supported in Nokia phone	Use Bluetooth accessory with Bluetooth profiles supported by phone
Poor FM radio reception (unable to detect many radio stations)	Nokia headset not being used	Use Nokia headset

BT and FM radio test coverage

The tests listed in the table below should be performed to verify whether the Bluetooth and FM receiver are functional. The use of self tests is described in section *Bluetooth and FM radio self tests in Phoenix*.

Test	Test Coverage	Repair solution
Bluetooth Self Test: ST_LPRF_IF_TEST	Bluetooth-FM ASIC UART interface (controls Bluetooth and FM receiver and transmitter)	Replacement of BOB module (or repair of phone BB)
Bluetooth Self Test: ST_BT_WAKEUP_TEST	Bluetooth ASIC interrupt control interface	Replacement of BOB module (or repair of phone BB)
Bluetooth Self Test: ST_LPRF_AUDIO_LINES_TEST	Bluetooth ASIC PCM interface	Replacement of BOB module (or repair of phone BB)

Test	Test Coverage	Repair solution
Bluetooth Functional Test: BER test with BT-Box or functional test with other Bluetooth device	Bluetooth antenna circuit	Repair of Bluetooth antenna circuit (including RF filter or WLAN switch if fitted)
FM Radio Functional Test: Perform scan for local radio stations and check station list displayed on phone	FM receiver antenna circuit	Repair of FM antenna circuit (between BTHFMWLAN ASIC and headset connector)
FM Radio Functional Test: Listen to local radio station	FM receiver audio circuit	Repair of FM receiver audio circuit (between BTHFMWLAN ASIC and headset connector)

The self tests run from Phoenix software are used for fault diagnosis.

If Phoenix software is not available, the functional tests with phone accessories are sufficient to verify the functionality of Bluetooth and FM radio receiver.

If Bob1.0M-b module has been replaced, the WLAN tuning must be performed to ensure that the output complies with ETSI/ FCC legal limits.

Introduction to WLAN troubleshooting

The following problems can occur with the WLAN hardware:

Symptom	Problem	Repair solution
Unable to switch on WLAN on phone user interface	Open circuit solder joints or component failure of BOB module	Replacement of BOB module or Host
Able to turn on WLAN via phone user interface, but unable to detect any WLAN APs or other WLAN devices	Open circuit solder joints or component failure of BOB module or filter	Replacement of BOB module or filter
Able to turn on WLAN via phone user interface and find APs and other WLAN devices, but not able to connect	Problem with TX part of WLAN circuit	Replacement of BOB module
Slow download speed when using WLAN as connection method	System clock possibly degraded	Change system clock source

Users may experience the following problems resulting in functional phones being returned to the repair centre:

Symptom	Problem	Repair solution
WLAN does not operate as desired with another WLAN device	Other WLAN device is not conforming to ETSI/FCC specifications	Use only certified WLAN products

WLAN test coverage

The tests listed in the table below should be performed to verify whether WLAN is functional. WLAN should be re-tested after repair.

Test	Test Coverage	Repair solution
WLAN Self Test: ST_WLAN_TEST	WLAN SPI and control interface (data interface and control of WLAN)	Replacement of BOB module
Bluetooth Functional Test: BER test with BT-Box or functional test with another Bluetooth device	Antenna connection from module, including filter	Replacement of BOB module or antenna components
WLAN TX Tuning	Checks WLAN TX path up to module output and calibrates the new module if fitted	Replacement of BOB module or antenna components

The self tests run from Phoenix software are used for fault diagnosis.

If Phoenix software is not available, the functional tests with phone accessories are sufficient to verify the functionality of WLAN.

Bluetooth and FM radio self tests in Phoenix

Prerequisites

A flash adapter (or phone data cable) connected to a PC with Phoenix service software is required.

Steps

1. Place the phone in the flash adapter or connect data cable to phone.
2. Start *Phoenix* service software.
3. Choose **File → Scan Product**.
4. From the **Mode** drop-down menu, set mode to **Local**.
5. Choose **Testing → Self Tests**.
6. In the *Self Tests* window check the following Bluetooth and FM radio related tests:
 - **ST_LPRF_IF_TEST**
 - **ST_LPRF_AUDIO_LINES_TEST**
 - **ST_BT_WAKEUP_TEST**

7. To run the tests, click **Start**.

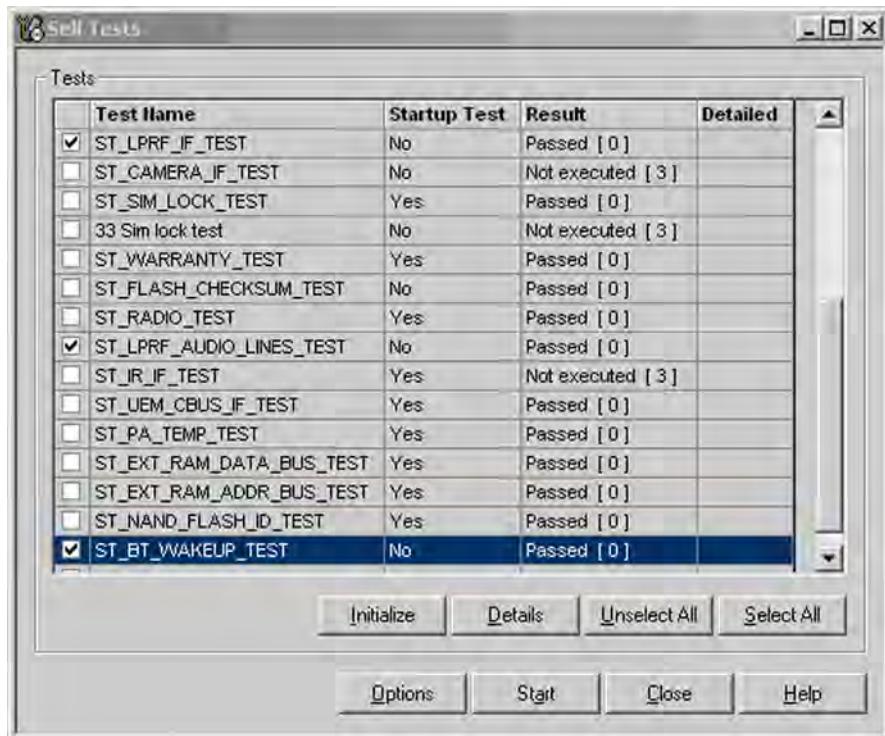

Figure 15 Bluetooth and FM radio self tests in *Phoenix*

WLAN self test in Phoenix

Prerequisites

A flash adapter (or phone data cable) connected to a PC with Phoenix service software is required.

Steps

1. Place the phone in the flash adapter or connect data cable to phone.
2. Start *Phoenix* service software.
3. Choose **File** → **Scan Product**.
4. From the **Mode** drop-down menu, set mode to **Local**.
5. Choose **Testing** → **Self Tests**.
6. In the *Self Tests* window check the following WLAN test:
 - **ST_WLAN_TEST**
7. To run the test, click **Start**.

Bluetooth BER test in Phoenix

Prerequisites

JBT-9, or SB-6 Bluetooth test box (BT-box) is required to perform a BER test. If a BT-box is not available, Bluetooth functionality can be checked by transferring a file to another Bluetooth phone.

Steps

1. Connect data cable to phone.
2. Start *Phoenix* service software.

3. Choose **File → Scan Product**.
4. Choose **Testing → Bluetooth LOCALS**.
5. Locate the BT-box serial number (12 digits) found in the type label on the back of the JBT-9, or SB-6 Bluetooth test box.
6. In the Bluetooth *LOCALS* window, write the 12-digit serial number on the *Counterpart BT Device Address* line.
7. Place the BT-box near (within 10 cm) of the phone and click **Start BER Test**.

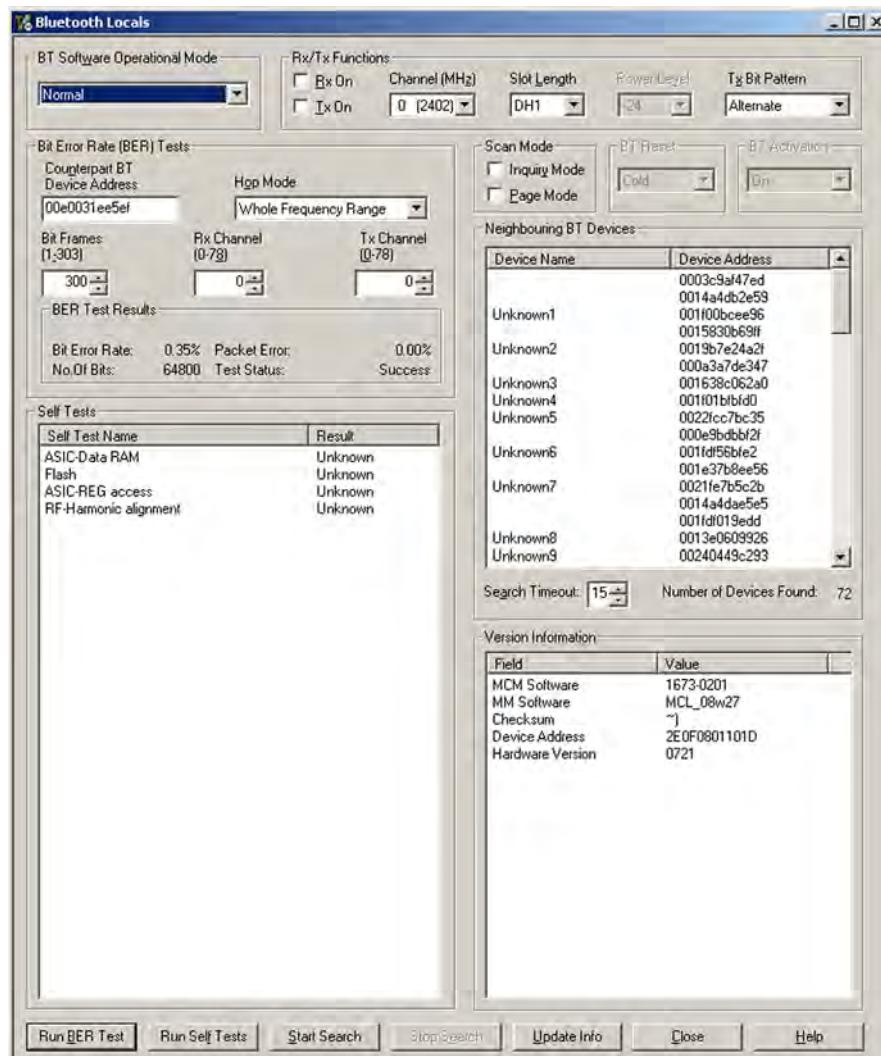

Figure 16 Bluetooth BER test in Phoenix

FMRX radio receiver testing

Steps

1. Set signal generator parameters:
 - FM modulation on
 - Frequency 100MHz
 - FM deviation 22kHz
 - Modulation frequency 1kHz
 - RF level should be varied during the test to obtain good audio signal quality

- Connect suitable antenna to signal generator

Note: You may alternately use a known good FM radio broadcast as a test signal.

2. Attach the Nokia headset to the phone's AV connector.
3. Use Scroll button to autotune to the radio frequency.
4. Set volume to suitable level.
5. Check audio quality with a headset.

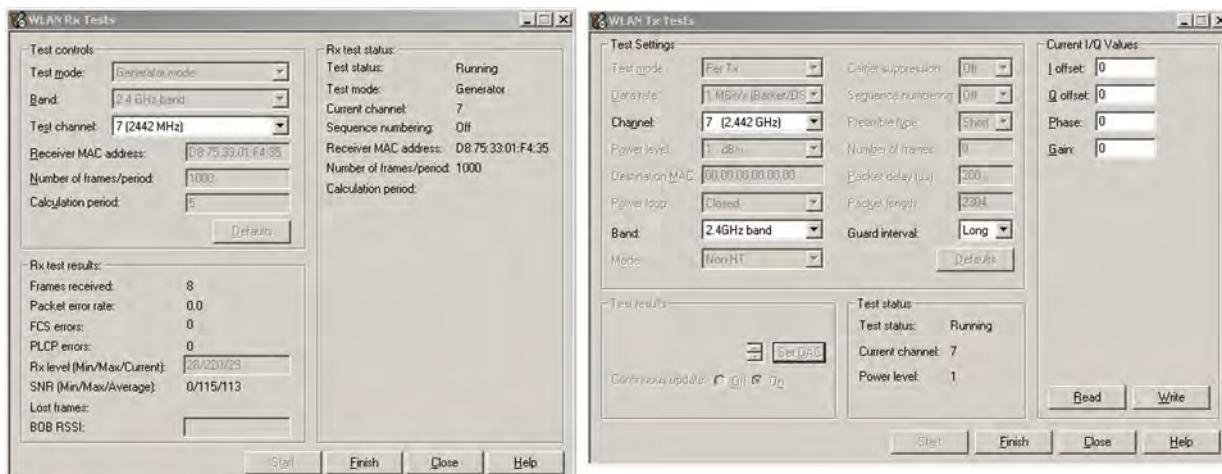

WLAN TX and RX testing in Phoenix

Context

The basic WLAN RX and TX functionality can be checked with Phoenix.

Steps

1. Place the phone in the flash adapter or connect data cable to phone.
2. Start *Phoenix* service software.
3. Choose **File → Scan Product**.
4. Choose **Testing → WLAN RX Tests** or **WLAN TX Tests**. See the following figures.

WLAN TX BiP testing procedure in Phoenix

Context

Note: This is an alternative procedure to tune the WLAN TX. The other, recommended procedure is described in chapter [WLAN TX BiP testing procedure in Testing and Tuning Tool \(page 3-66\)](#).

Note: No external measurement equipment is required as the calibration is completely handled internally. RF cable and adapter losses do not need to be taken into account while WLAN TX tuning is proceeded.

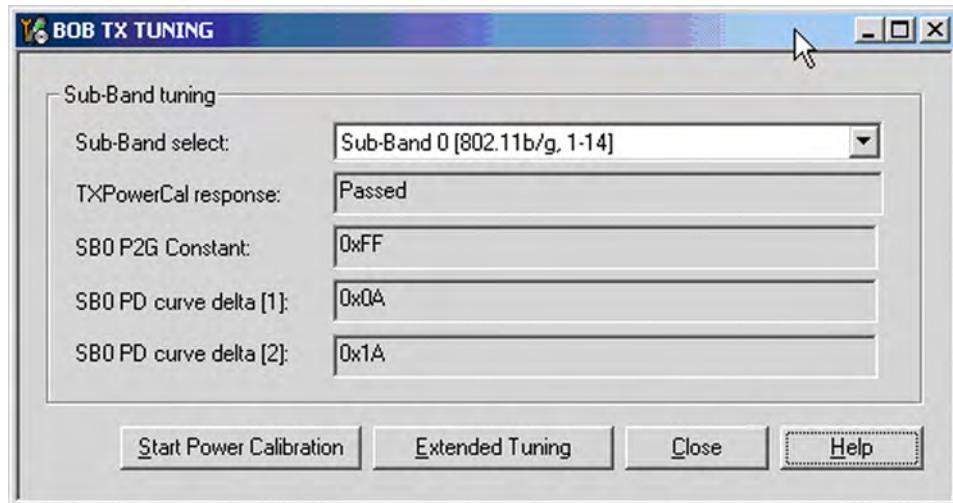

WLAN TX has been BiP (Build in Prduction line testing) tuned correctly in production. There is no reason to do re-calibration unless the Bob1.0M-b (N6300) is changed or memory (D3000) is corrupted.

WLAN TX can be tuned automatically with Testing and Tuning Tool. It performs calibrations and tunings of WLAN TX. The results are displayed and logged in a result file, if initiated.

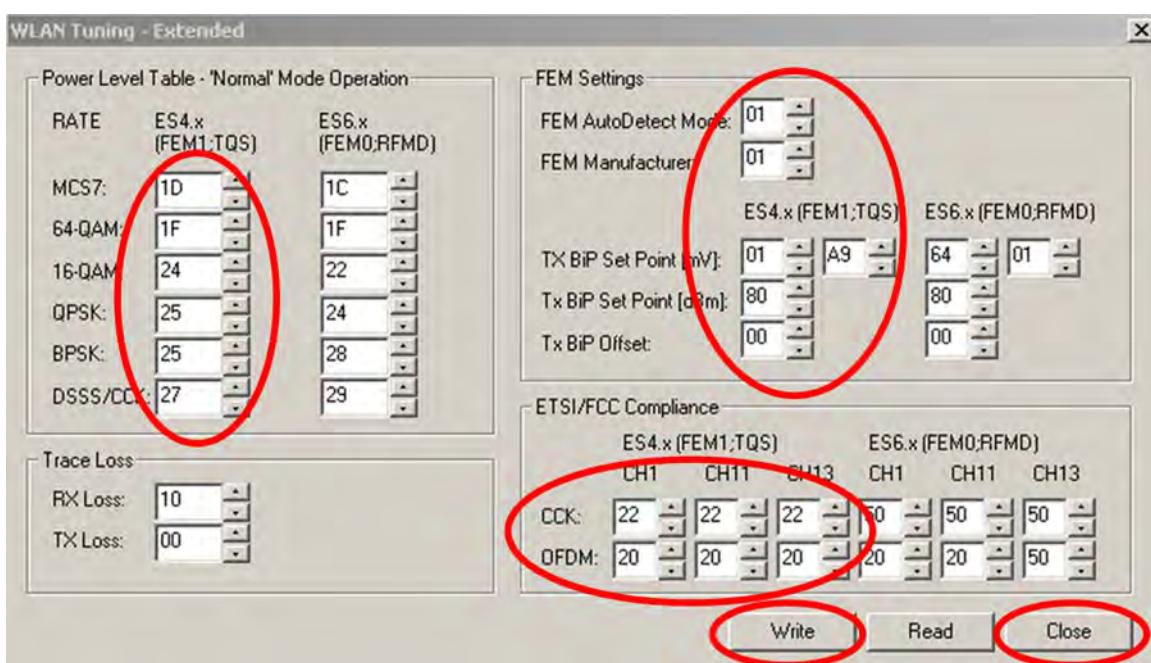

Steps

1. Place the phone in the flash adapter or connect data cable to phone.

2. Start *Phoenix* service software.
3. Choose **File** → **Scan Product**.
4. Choose **Tuning** → **WLAN_TX_TUNING**. See the following figure.

5. Select "Sub-Band 0" as indicated in the figure.
6. Open the **Extended Tuning** menu. See the following figure.

7. Type the correct tuning values. The values are circled in the figure above.
8. Click **Write** and **Close**.
9. Click **Start Power Calibration** and read the result from the **Result** box.
10. If TXPowerCal response returns 'Passed' results, the WLAN TX BiP test is successful.

WLAN TX BiP testing procedure in Testing and Tuning Tool

Context

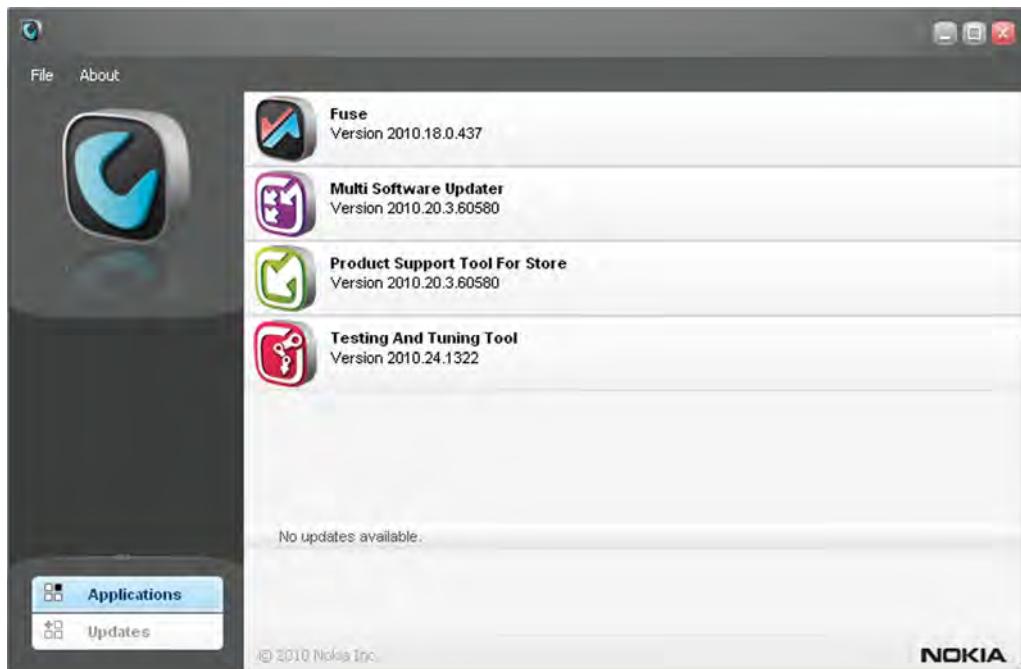

Note: No external measurement equipment is required as the calibration is completely handled internally. RF cable and adapter losses do not need to be taken into account while WLAN TX tuning is proceeded.

WLAN TX has been BiP (Build in Production line testing) tuned correctly in production. There is no reason to do re-calibration unless the Bob1.0M-b (N6300) is changed or memory (D3000) is corrupted.

WLAN TX can be tuned automatically with Testing and Tuning Tool. It performs calibrations, tunings and measurements of WLAN TX. The results are displayed and logged in a result file, if initiated.

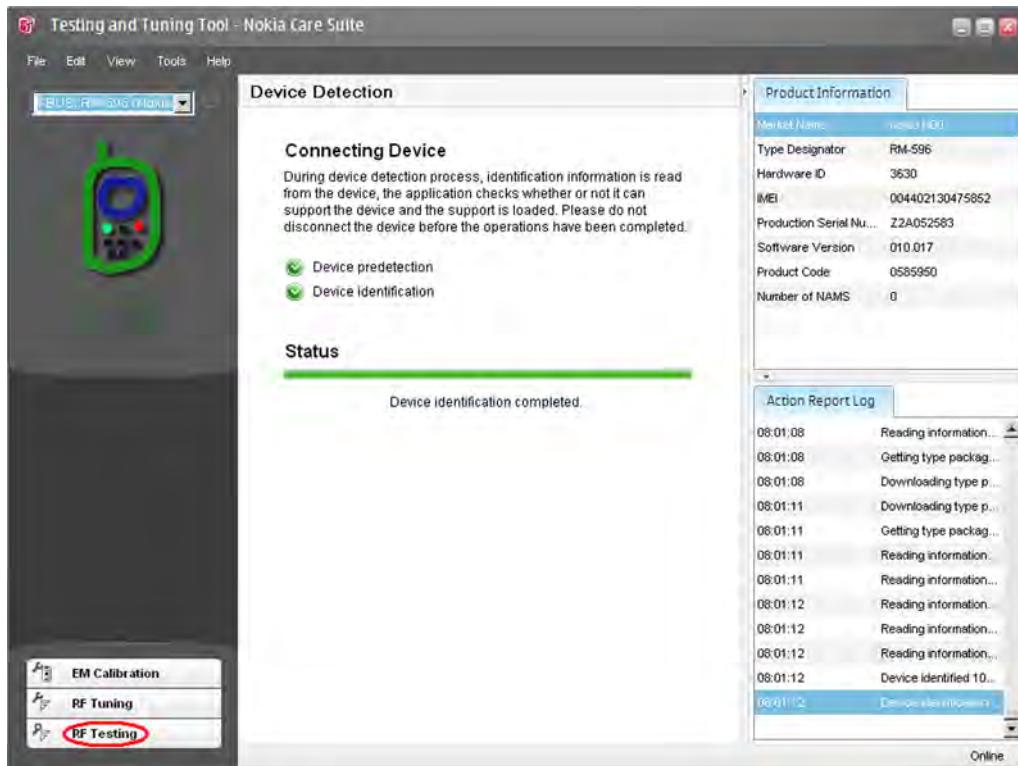

Steps

1. Make sure the phone is connected to the PC.
2. Start *Nokia Care Suite* application.

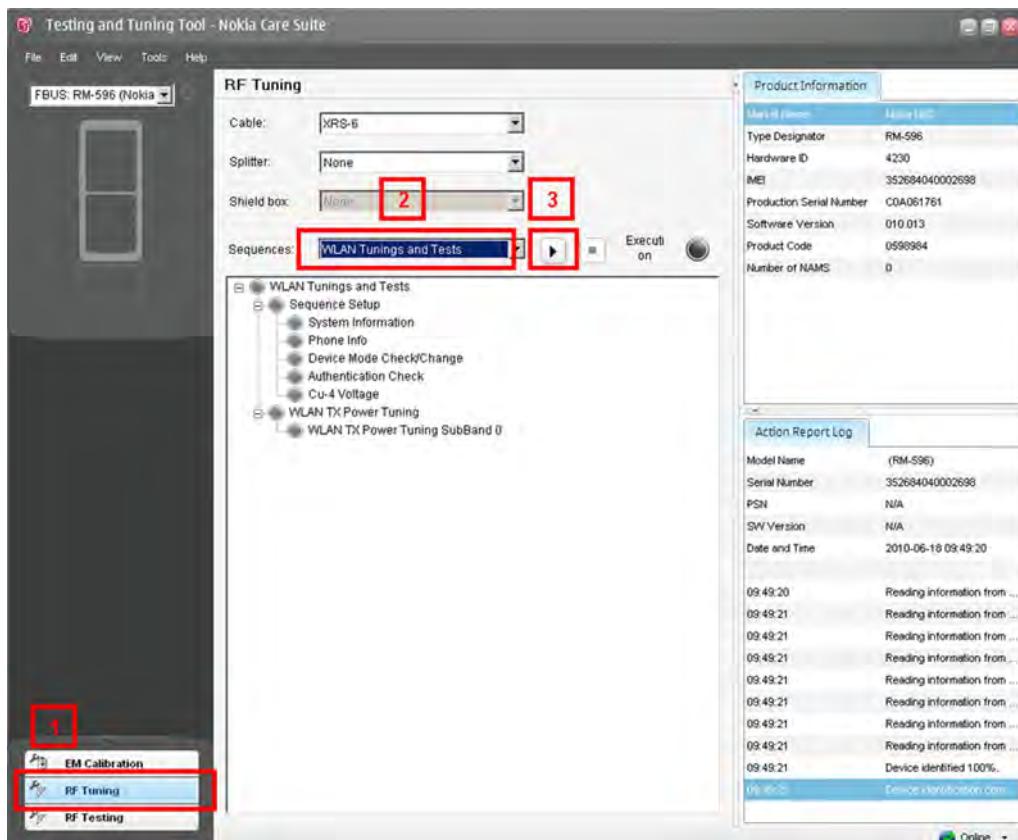

3. To open the application, double-click the **Testing And Tuning Tool** icon.

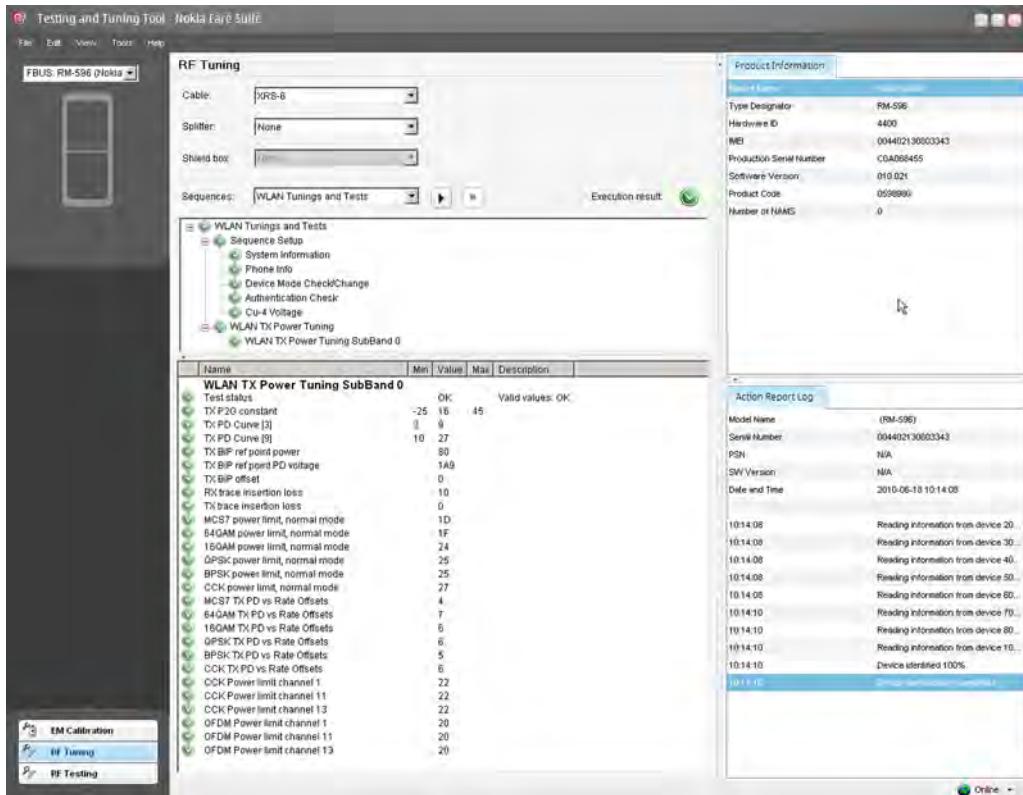

4. If the application is able to find a connected phone, the following view will open:

5. Click on the **RF Tuning** button and select from the drop-down menu:

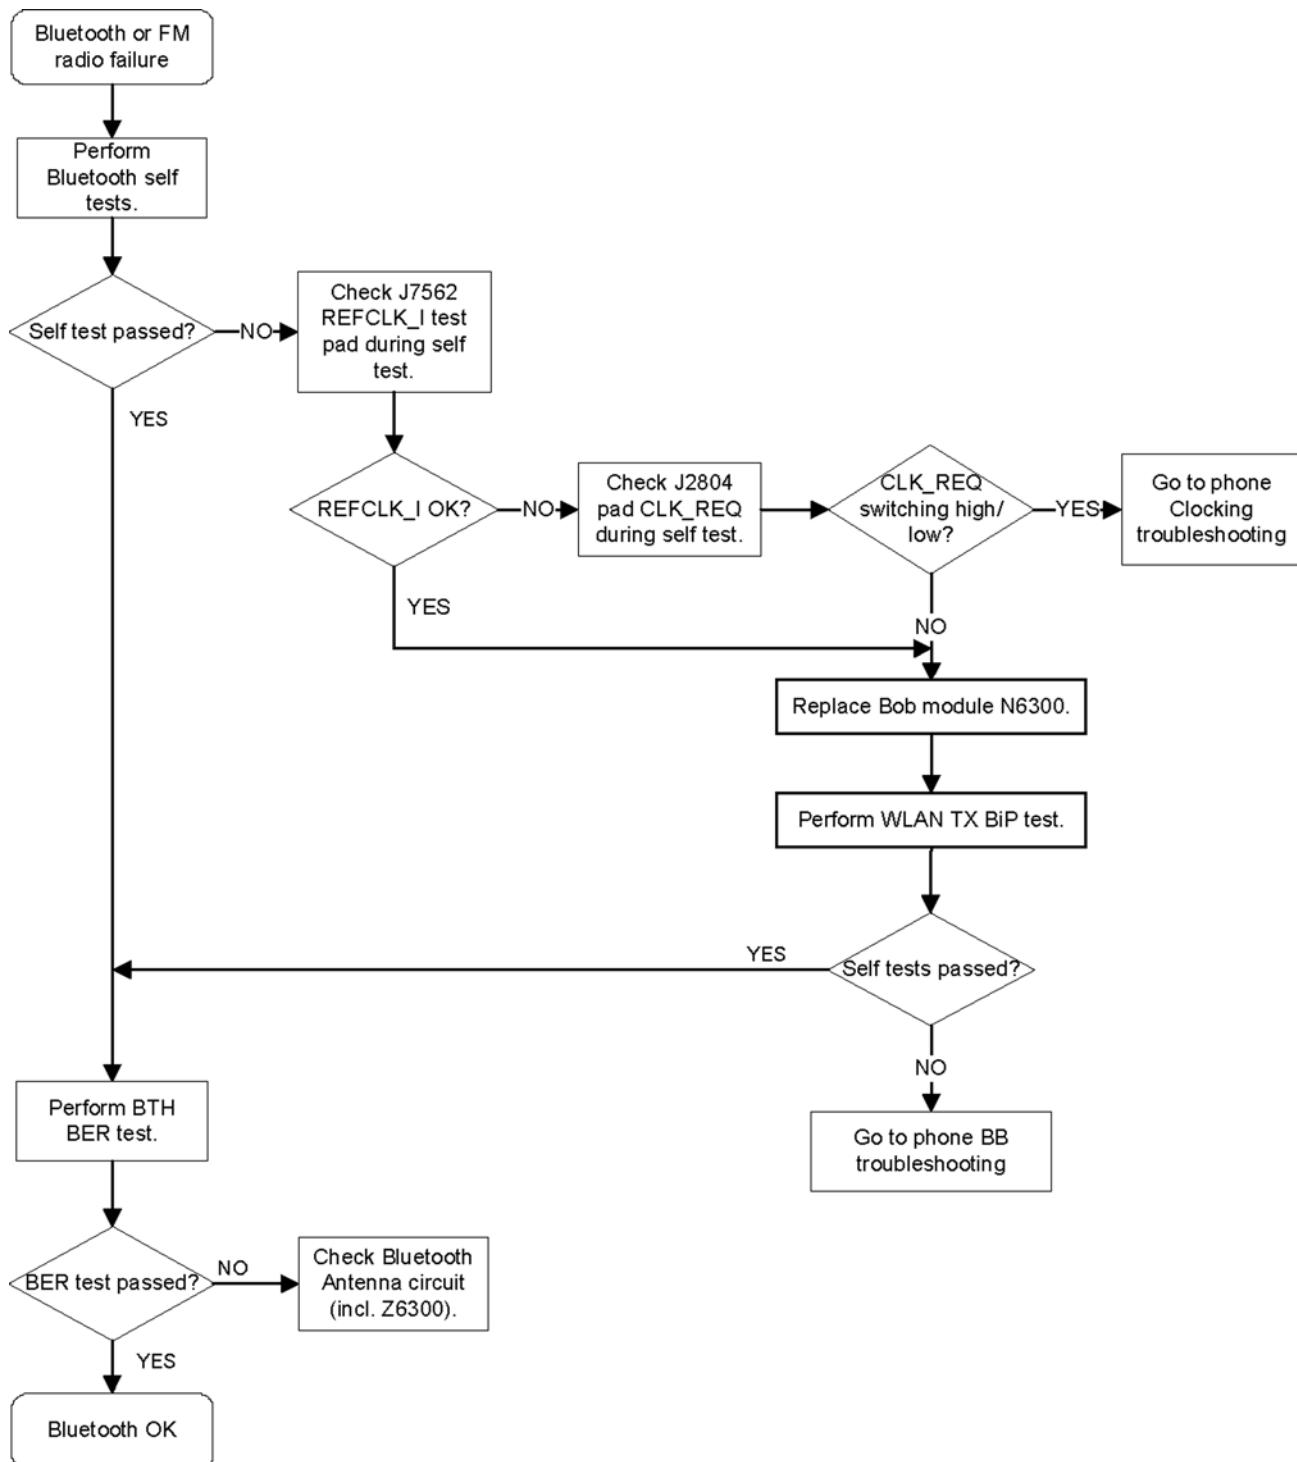

6. RF tunings will be ready when all the tunings and measurements are green in the tool window and no errors occur.

7. If errors do happen, failed tuning/testing steps are marked with a red color and more detailed results are shown on the screen.

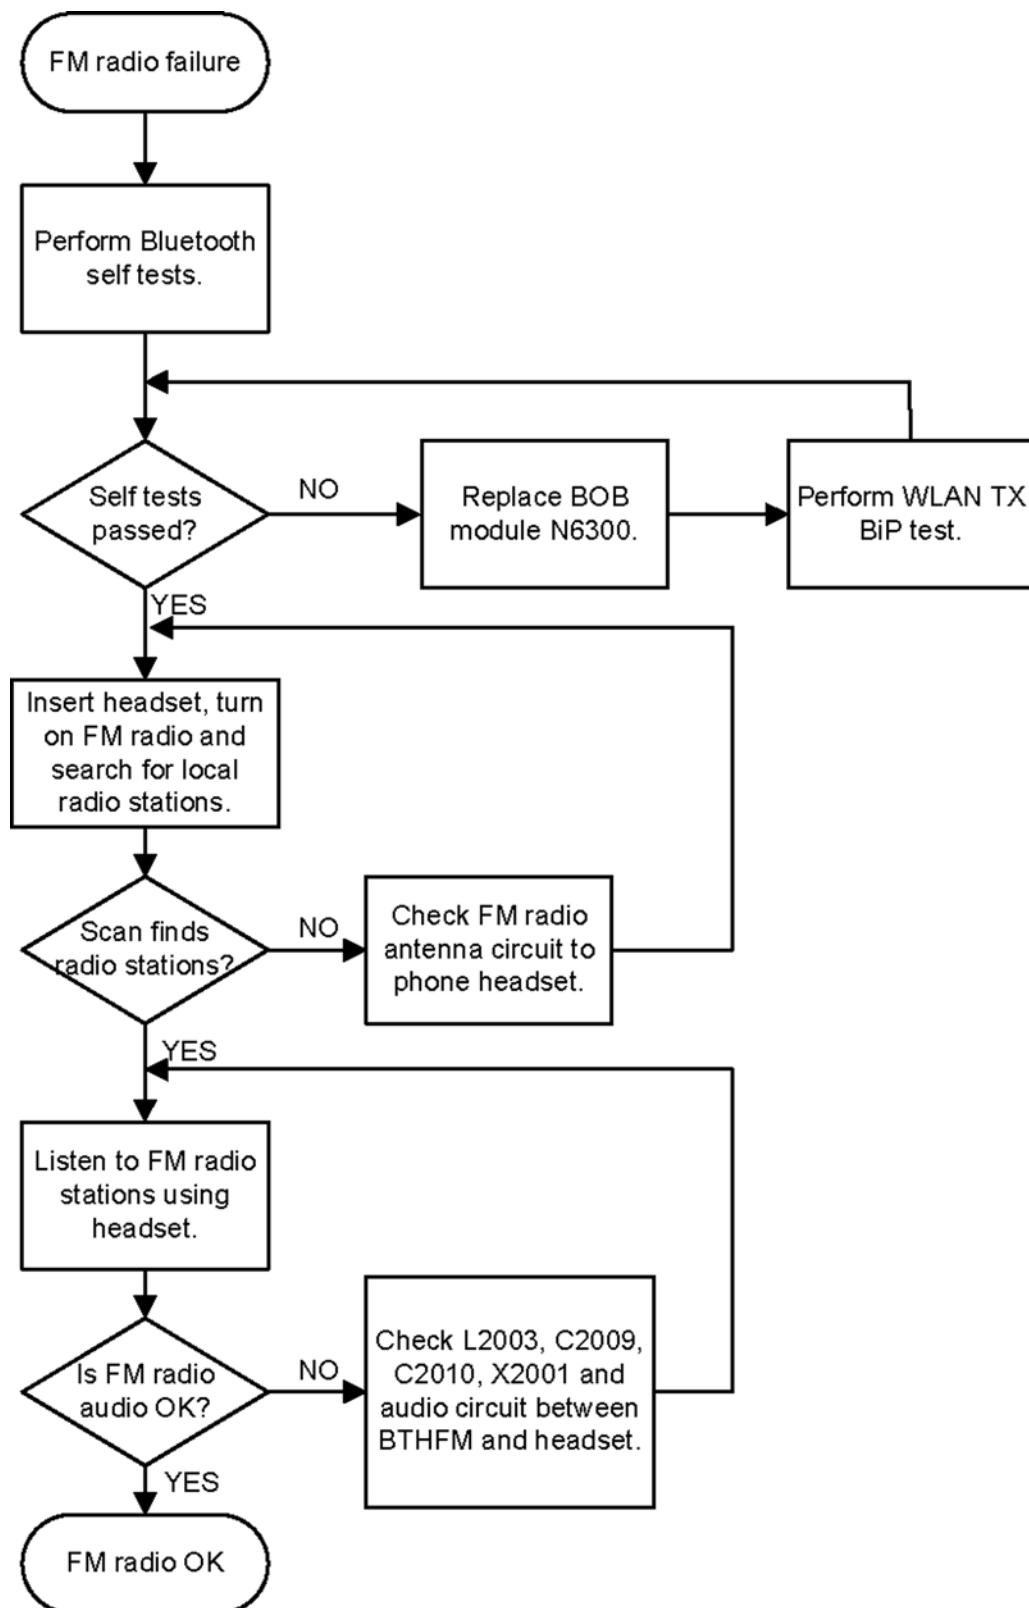

Bluetooth troubleshooting

GPS troubleshooting

Introduction to GPS troubleshooting

GPSCost4.1D is a single chip GPS receiver, comprising both RF and BB blocks integrated in a single digital die. GPSCost4.1D is connected to RAPU ASIC via I₂C_1 and some GENIOs. GPSCost4.1D operates in Multi-master mode and the REF clock is requested via AGPS_CLK_REQ signal connected to RAPU genio46. REFOUT_EXT2 single ended 38.4 MHz analog clock from Linko RF is provided to GPSCost4.1D.

The GPS components are located on the bottom side of the PWB. Satellite signals are picked up by the GPS antenna in the top end cap. The signal is then processed by the GPS5350 receiver ASIC.

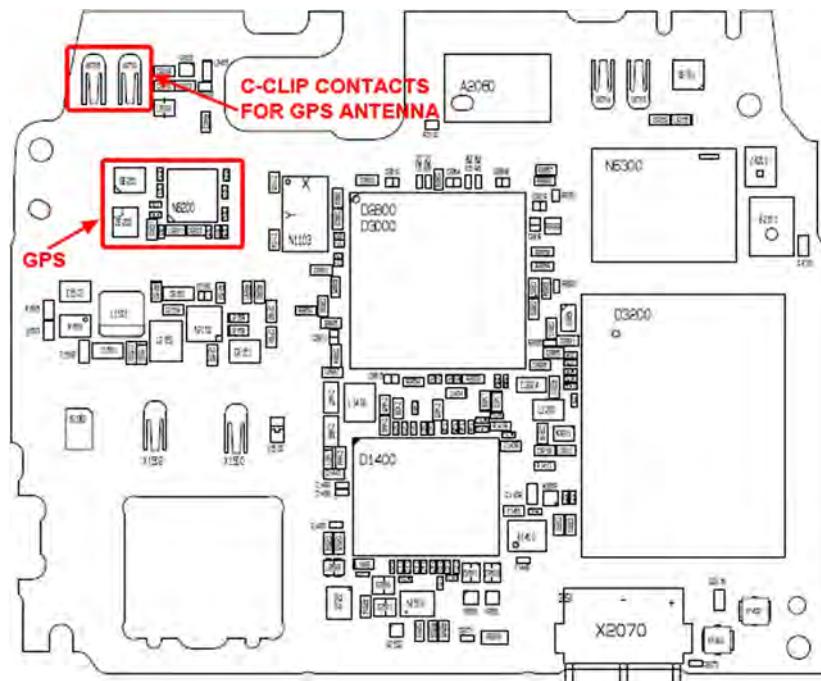

Figure 17 Component layout, bottom side

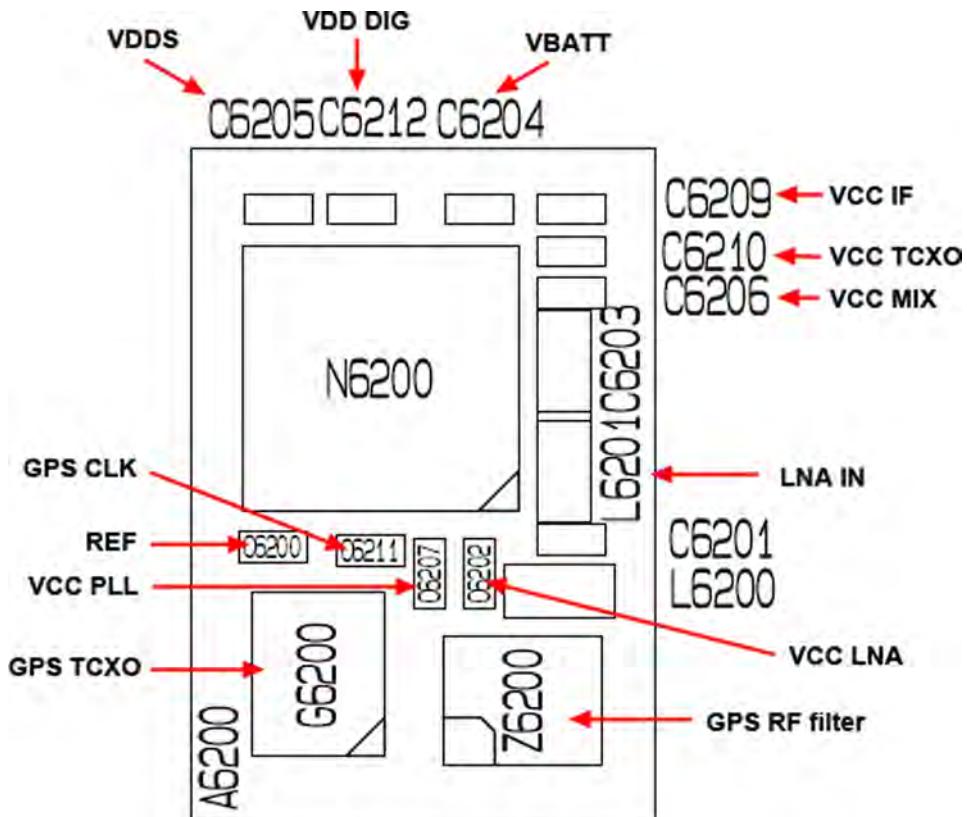

Figure 18 GPS layout and basic test points

GPS settings for Phoenix

Quick Test window

This test will perform 3 tests in one: Self test, Oscillator Test and CW Test and will provide a Pass/Fail Response for each. The HW Self Test confirms basic communication with the GPS ASIC. The oscillator test confirms the frequency accuracy of the GPS TCXO against the Ref_Clk. The CW Test confirms end-to-end connectivity between the GPS antenna and the GPS ASIC. It also contains a receive button.

Before this test is performed a known good phone should be tested in order to calibrate the setup. The signal level of the Signal Generator should be adjusted so a reading of SNR 35 dB is achieved with the reference unit. A good starting point is to set up the signal generator to -50 dBm.

These checks are part of *GPS failure troubleshooting*.

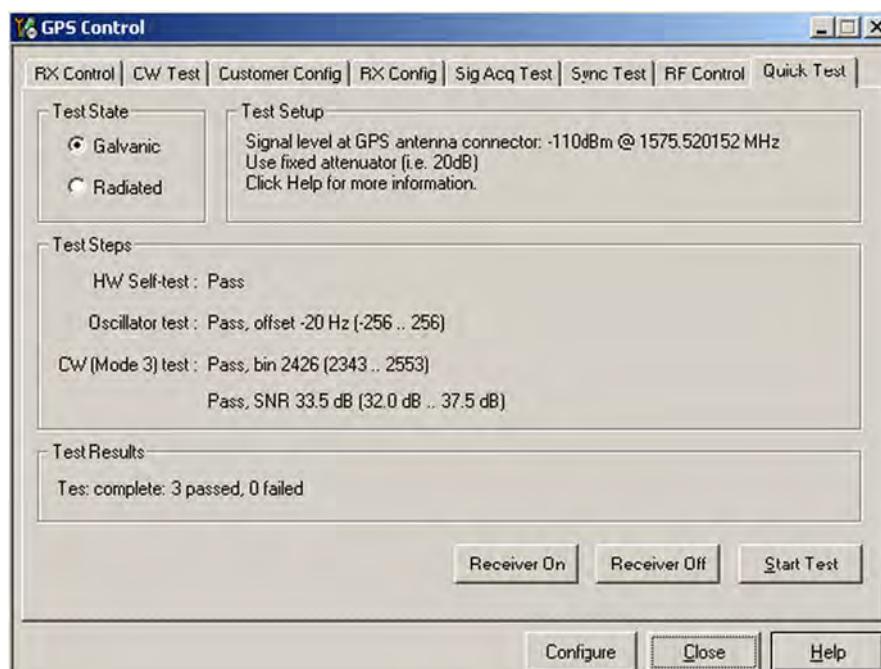

Figure 19 GPS Quick Test window

GPS control

Prerequisites

A flash adapter with RF connector connected to a PC with Phoenix service software is required. The GPS signal should be connected to the RF connector. Calibrate the signal level with a known good phone. Signal level will be high (approx -45 dBm) because it is a leakage connection.

Context

Use the following to test GPS using Phoenix.

Steps

1. Place phone to Flash Adaptor.
2. Start Phoenix service software.
3. From the **File** menu, select **Scan Product** and check that the correct product version is displayed.

4. From the **Testing** menu, select **GPS Control**. This opens up *GPS Control*/dialogue box, as shown in the figure below, and enables the GPS.

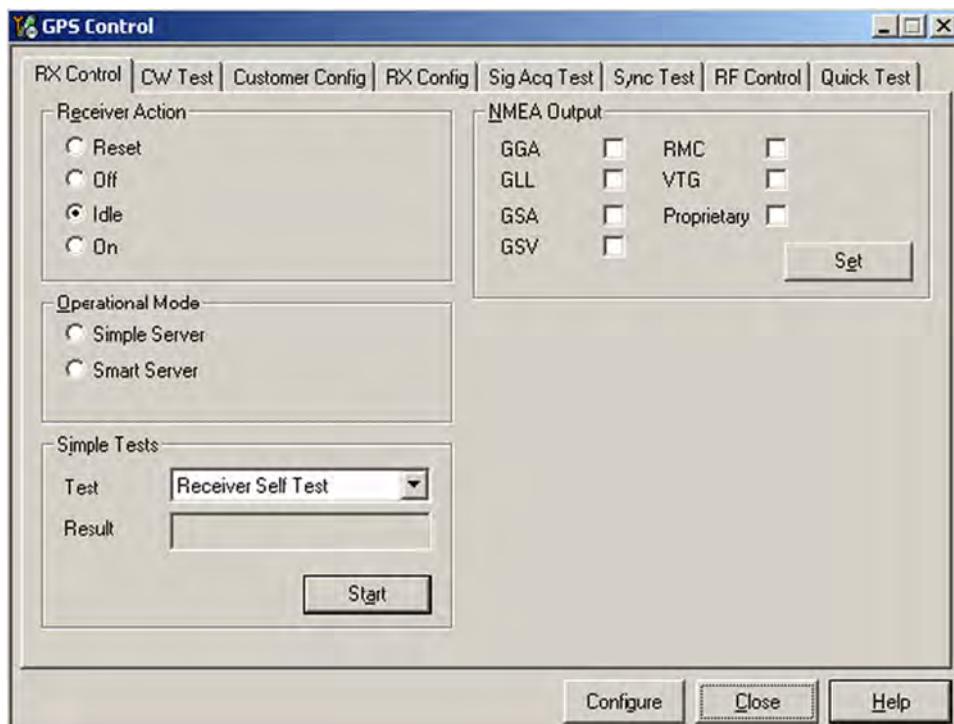

Figure 20 GPS Control dialogue box

Select **Idle** to confirm the GPS is enabled and is in idle mode; at this point all clocks should be present, GPS_En_Reset & SleepX should be high, and Vdd_Dig, Vcc_TCXO & Vcc_PLL/VCO will be present.

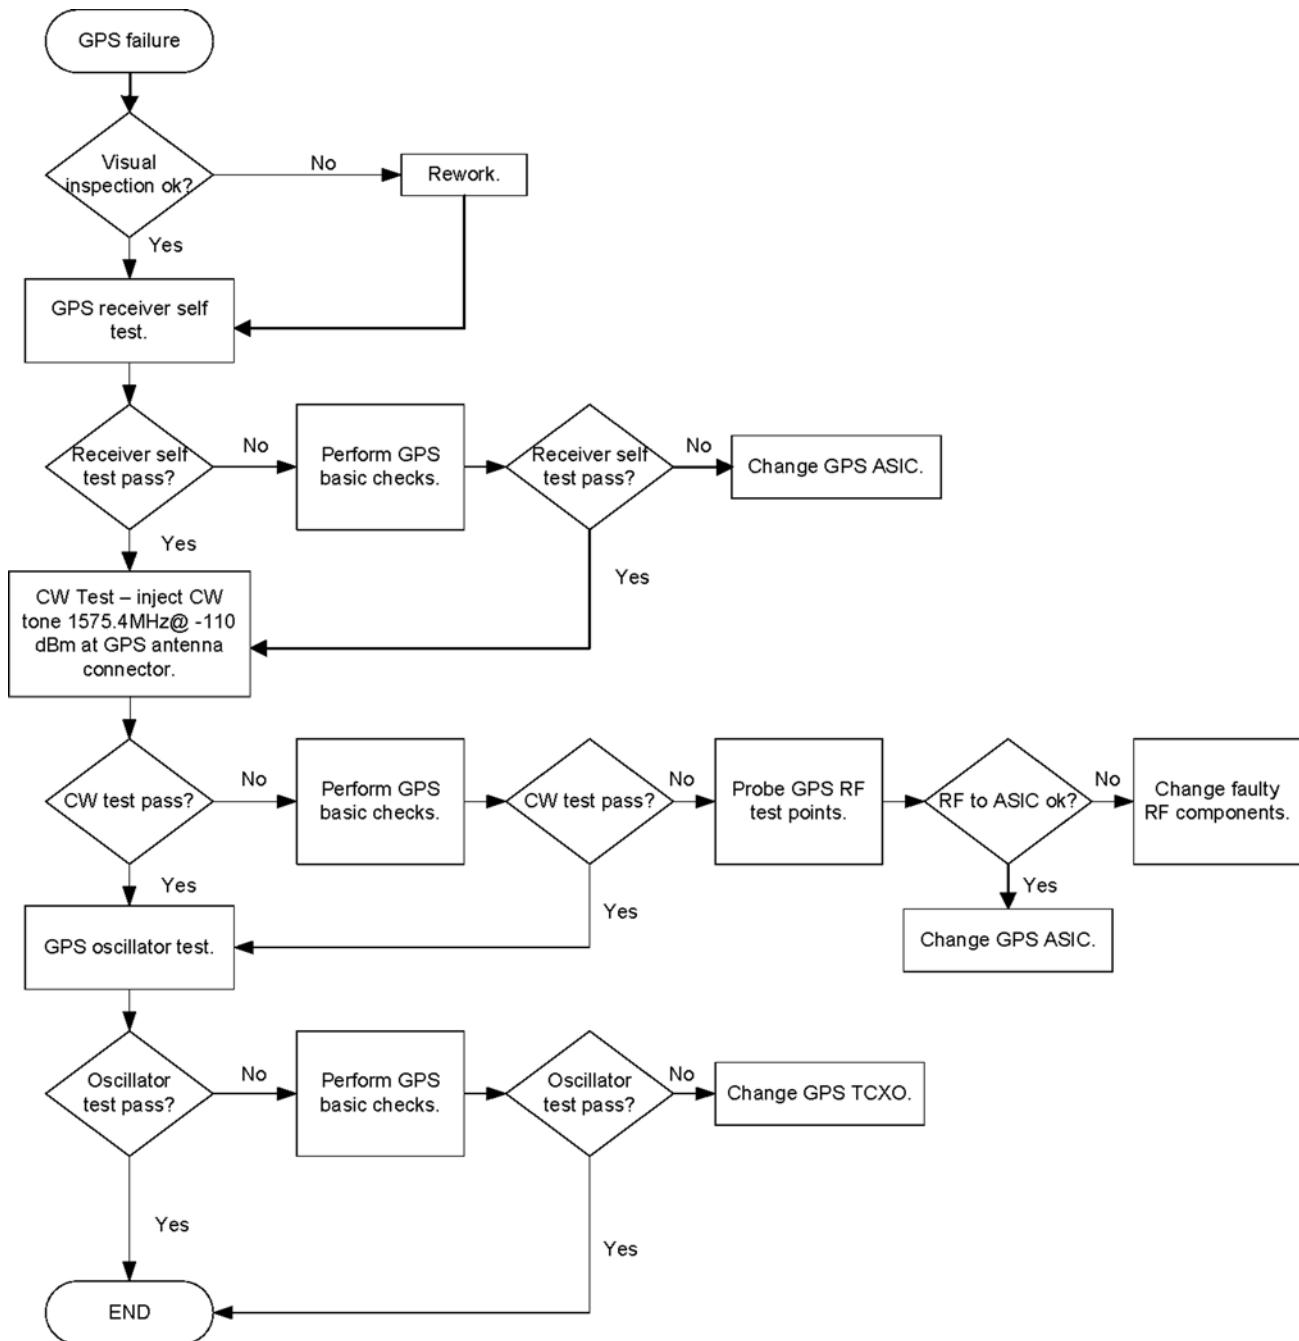

Receiver On turns on all RF sections of the ASIC and so all LD0s will be on.

GPS failure troubleshooting

Context

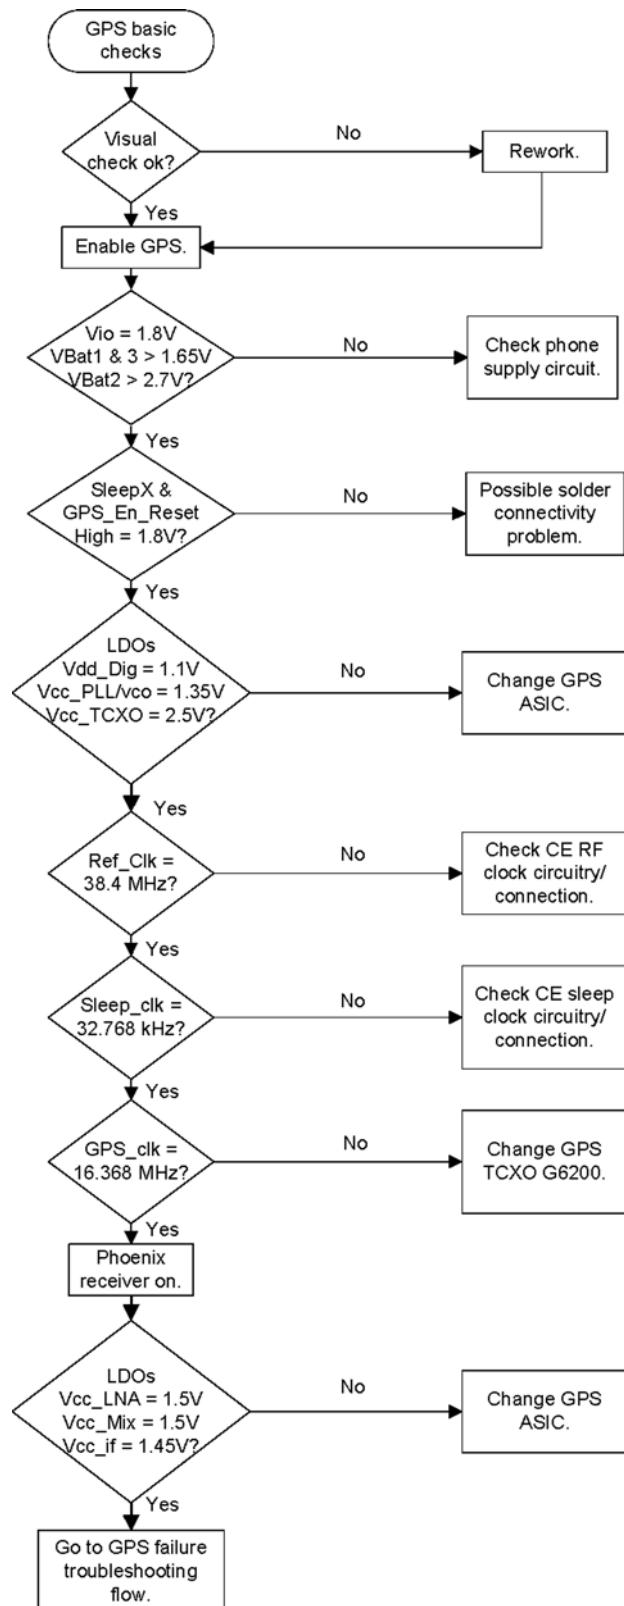

GPS troubleshooting is broken down into two parts: general GPS failure troubleshooting and GPS basic checks troubleshooting. The GPS failure troubleshooting flow can be followed and, where applicable, will feed into the GPS basic checks troubleshooting flow.

Troubleshooting flow

GPS basic checks troubleshooting

Troubleshooting flow

■ Baseband manual tuning guide

Certificate restoring

Context

This procedure is performed when the device certificate is corrupted for some reason.

All tunings (RF & Baseband, UI) must be done after performing the certificate restoring procedure.

Required equipment and setup:

- Latest *Phoenix* service software.
- “Tucson add on” package if one has been released between complete Phoenix releases
- FPS-10 or 21 Flash prommer updated with latest flash update package.
- Latest product specific data package, supporting for the variants you want to change the phones to.
Certificate restoring without flashing does not require data packages to be installed
- SX-4 or SX-4T Smart Card, which has been registered for Tucson use in Nokia Online Security Device Master, and for which local Nokia Care has granted Tucson user rights
- BB 5.0 models: SS-46 with phone specific flash adapter connected to flash prommer
- DCT-4 models: JBV-1 with phone specific flash adapter connected to flash prommer
- Active online connection to internet, please refer to Technical Bulletins for IP addresses

Connection to Tucson online server:

- All requests are handled online. That means a permanent Internet connection is required. Previously used e-mail based system is no longer in use.
- Phoenix, when contacting Tucson server, is using IP address, **147.243.3.169 port 443**

Terms in Tucson:

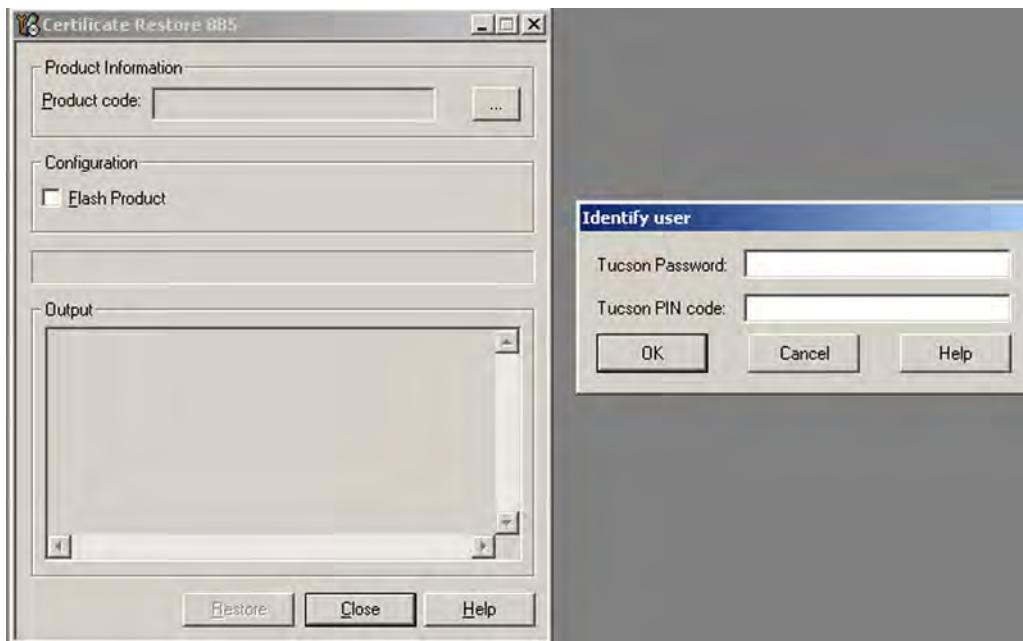

- When certificate restoring for BB 5 products or IMEI rebuild for DCT-4 products is performed, existing data from Nokia System is programmed in the phone. The phone will be in the same condition as it was when it left the factory for the first time.
- If “Product Code Change” has been SUCCESSFULLY performed with Tucson after the phone left the factory, it will be restored back to the variant it was made into during Product Code change event.
- It is recommended to perform “Restore” function without selecting “Flash Product” – option to avoid possible SW downgrade which causes the phone to die.

The procedure for certificate restoring is the following:

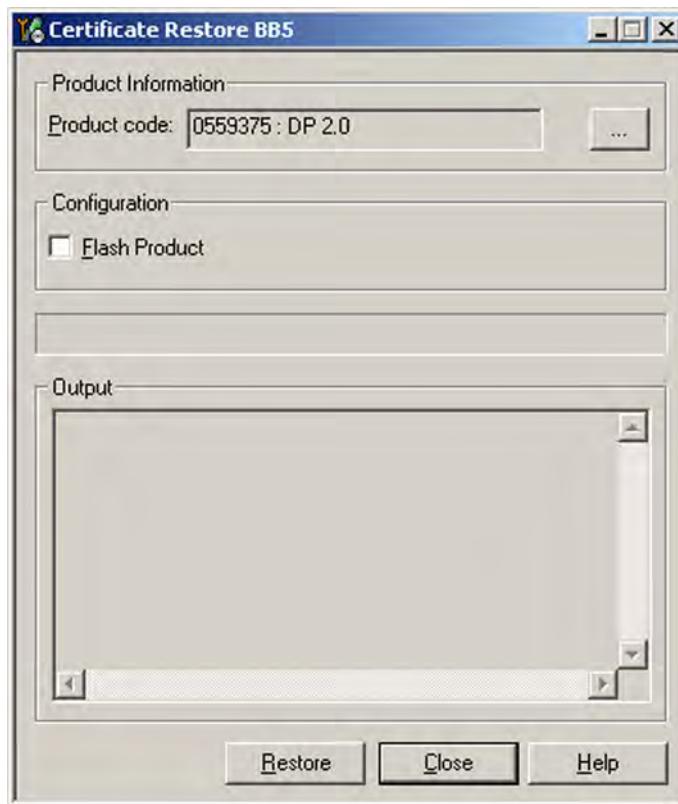

Steps

1. Connect phone and scan product, read phone information to check communication with phone.
2. Open *Tools->Menu*.

3. Provide Tucson password and PIN code which have been delivered to you by email. Please note that characters are case sensitive.

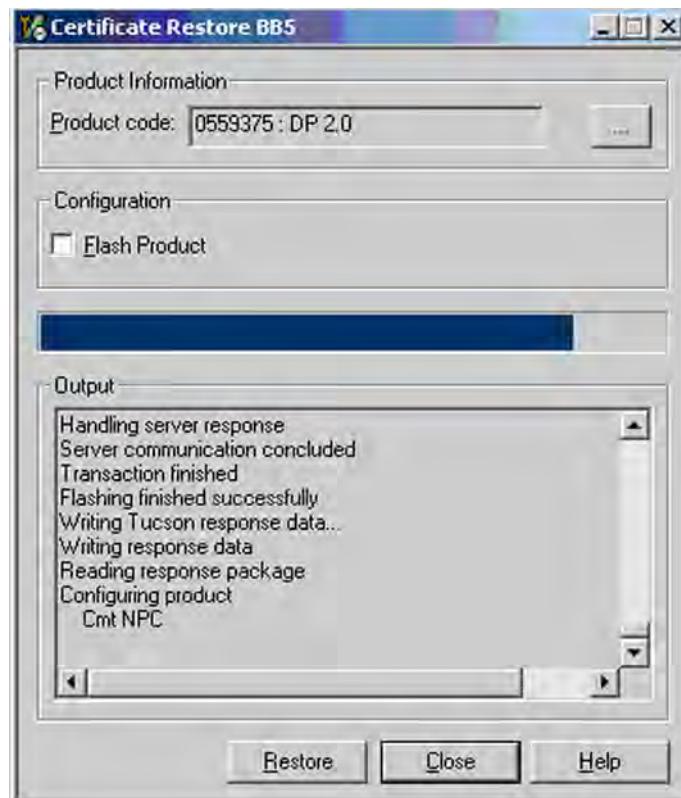

4. Select OK, Phoenix will read product information from phone.
5. Product code shown on the UI does not matter, because during restoring it will be replaced by the product code which is the latest one stored in Nokia system.
6. It is recommended to perform "Restore"-function without selecting "Flash Product"-option to avoid possible SW downgrade which causes the phone to die.

7. Information from phone and Smart Card are read and connection to Tucson server is established.

8. Information from Nokia system is retrieved and programmed in the phone.

9. After programming, confirmation about successful event is sent to Nokia system.

Next actions

After a successful rewrite, you must retune the phone completely by using *Phoenix* tuning functions.

Important: Perform all tunings: RF, BB, and UI.

Product code change

Context

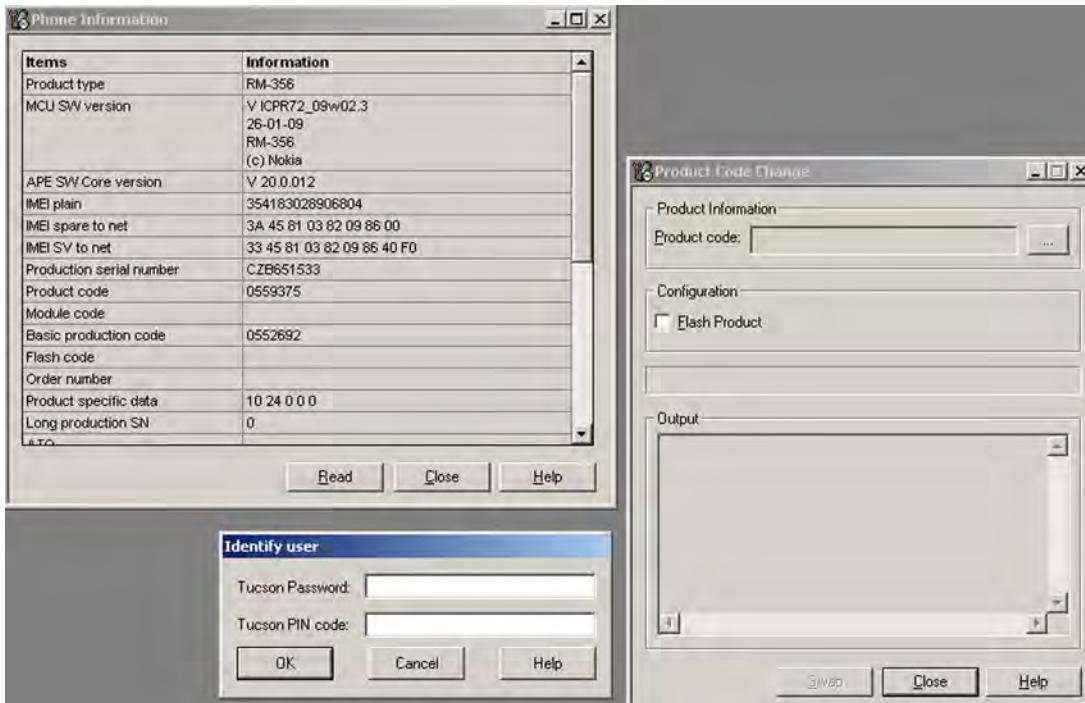

- When Product Code change with Tucson is successfully performed, phone variant will be changed. Data for the new variant is extracted from Nokia System, and programmed in the phone.
- After successful change, phone specific information in Nokia systems will match the new variant, and it can be used for e.g. certificate restoring. If you perform several product code changes, Nokia system will always be up to date with the latest successful event.
- Failed / incomplete actions will not change the phone specific information in Nokia systems.
- This function can be performed with or without flashing the phone with correct software, selection can be made by checking / unchecking the tick box on Phoenix UI.

The procedure for product code change is the following:

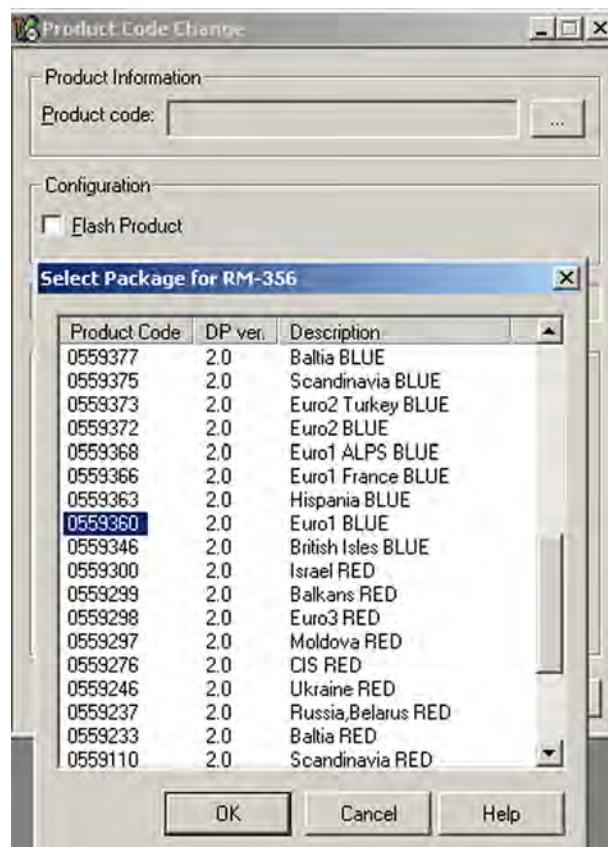

Steps

1. Connect phone and scan product, read phone information to check communication with phone
2. Open *Tools->Product Code Change*.

3. Provide Tucson password and PIN code which have been delivered to you by email. Please note that characters are case sensitive.

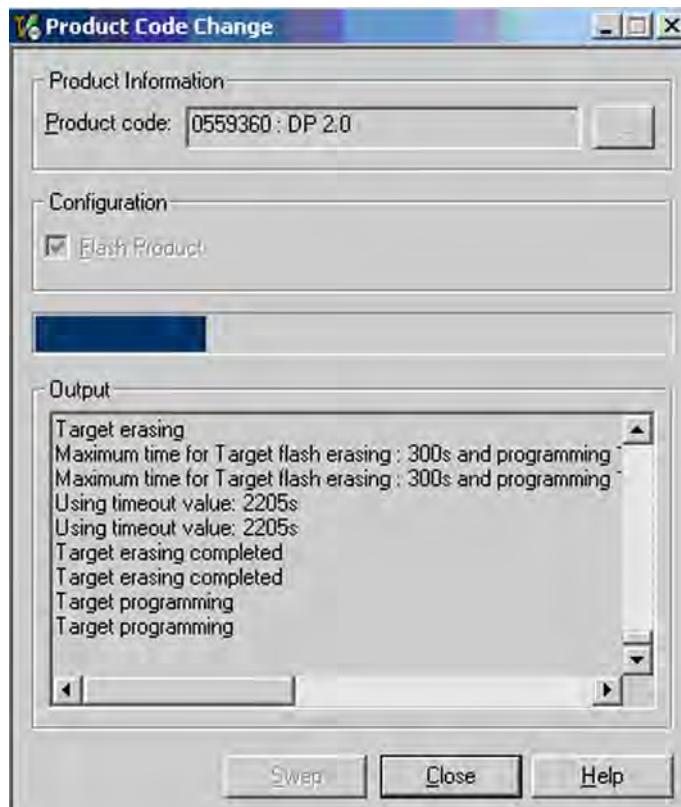

4. Select product code of new variant from list. If the product code you want is not shown, please install correct data package including the variant.
 5. Select "OK" and "SWAP".

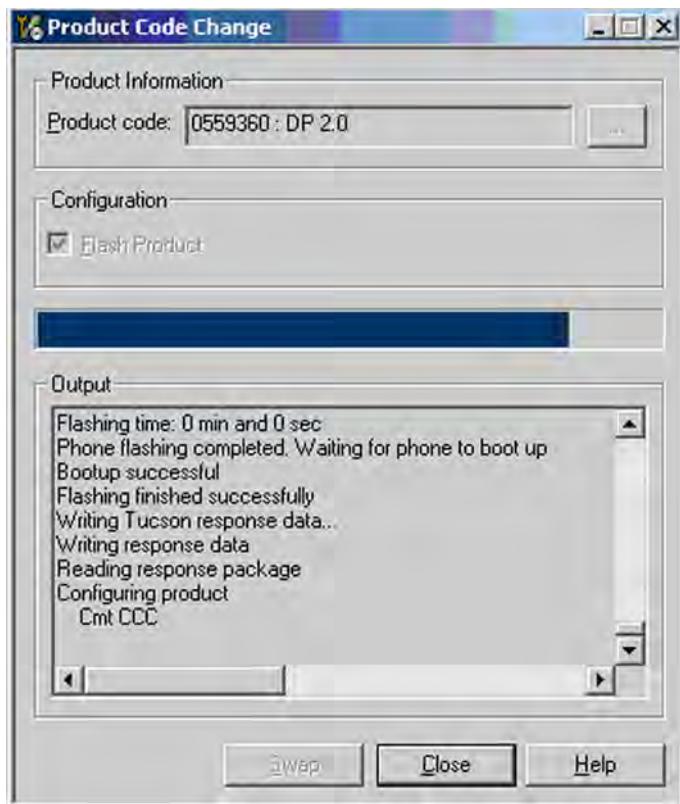

6. Information from phone is read and connection to Tucson server is established.

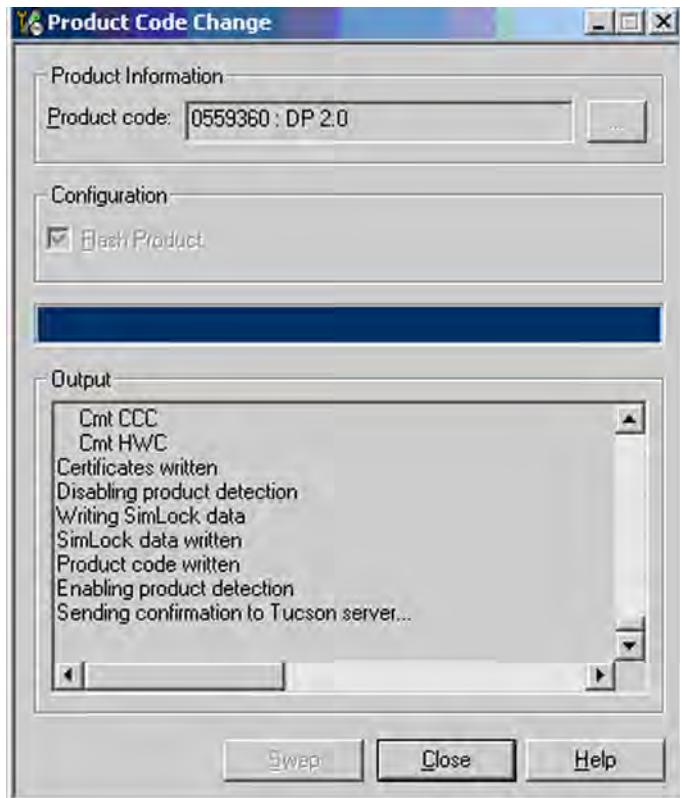

7. If "Flash Product" – option was selected, phone SW is programmed.

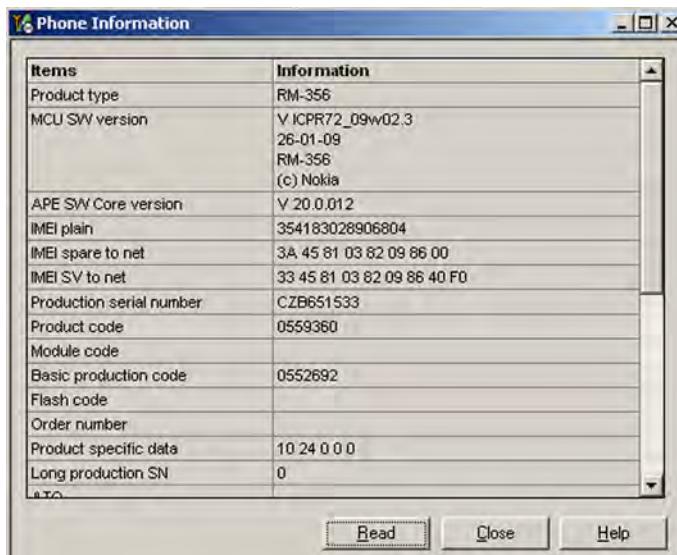

8. New data retrieved from Nokia system is programmed in the phone.

9. Confirmation about successful event is sent to Nokia system.

10. Phone has now been changed to another variant. If there is need to restore the data, this information will be sent back to phone. Warranty information in NOL will show the current information in about 24 hours.

Energy management calibration

Prerequisites

Energy Management (EM) calibration is performed to calibrate the setting (gain and offset) of AD converters in several channels (that is, **battery voltage**, **BSI**, **battery current**) to get an accurate AD conversion result.

Hardware setup:

- An external power supply is needed.
- Supply 12V DC from an external power supply to CU-4 to power up the phone.
- The phone must be connected to a CU-4 control unit with a product-specific flash adapter.

Steps

1. Place the phone to the docking station adapter (CU-4 is connected to the adapter).
2. Start *Phoenix* service software.
3. Choose **File** → **Scan Product**.
4. Choose **Tuning** → **Energy Management Calibration**.
5. To show the current values in the phone memory, click **Read**, and check that communication between the phone and CU-4 works.
6. Check that the **CU-4 used** check box is checked.
7. Select the item(s) to be calibrated.

Note: ADC calibration has to be performed before other item(s). However, if all calibrations are selected at the same time, there is no need to perform the ADC calibration first.

8. Click **Calibrate**.

The calibration of the selected item(s) is carried out automatically.

The candidates for the new calibration values are shown in the *Calculated values* column. If the new calibration values seem to be acceptable (please refer to the following "Calibration value limits" table), click **Write** to store the new calibration values to the phone permanent memory.

Table 9 Calibration value limits

Parameter	Min.	Max.
ADC Offset	-30	+40
ADC Gain	12000	14000
BSI Gain	1100	1350
VBAT Offset	2635	2755
VBAT Gain	14900	15900
VCHAR Gain	N/A	N/A
IBAT (ICal) Gain	7750	12250

9. Click **Read**, and confirm that the new calibration values are stored in the phone memory correctly. If the values are not stored to the phone memory, click **Write** and/or repeat the procedure again.
10. To end the procedure, close the *Energy Management Calibration* window.

■ General instructions for cellular RF troubleshooting

Most RF semiconductors are static sensitive

ESD protection must be applied during repair (ground straps and ESD soldering irons).

Measuring equipment

All measurements should be done using:

- An oscilloscope for low frequency and DC measurements. Recommended probe: 10:1, 10 Mohm//8 pF.
- Aeroflex (Willtek) 440x/3100, Rohde & Schwarz CMU-200 or CMW-500 radio communication tester.

Note: A mobile phone WCDMA transmitter should never be tested with full TX power (permitted only if measurements and tests are performed in an RF-shielded environment). Even low power WCDMA transmitters may disturb nearby WCDMA networks and cause problems to 3G cellular communication in a wide area.

Note: All measurements with an RF coupler should be performed in an RF-shielded environment because nearby base stations can disturb sensitive receiver measurements. If there is no possibility to use an RF-shielded environment, testing at frequencies of nearby base stations should be avoided.

Note: All communication test set screen dumps are from CMU-200. Other testers are different.

RF auto tune

Cellular RF parameters should always be re-tuned by means of Testing and Tuning Tool if one or more of the RF components have been changed or memory (D3000) is corrupted.

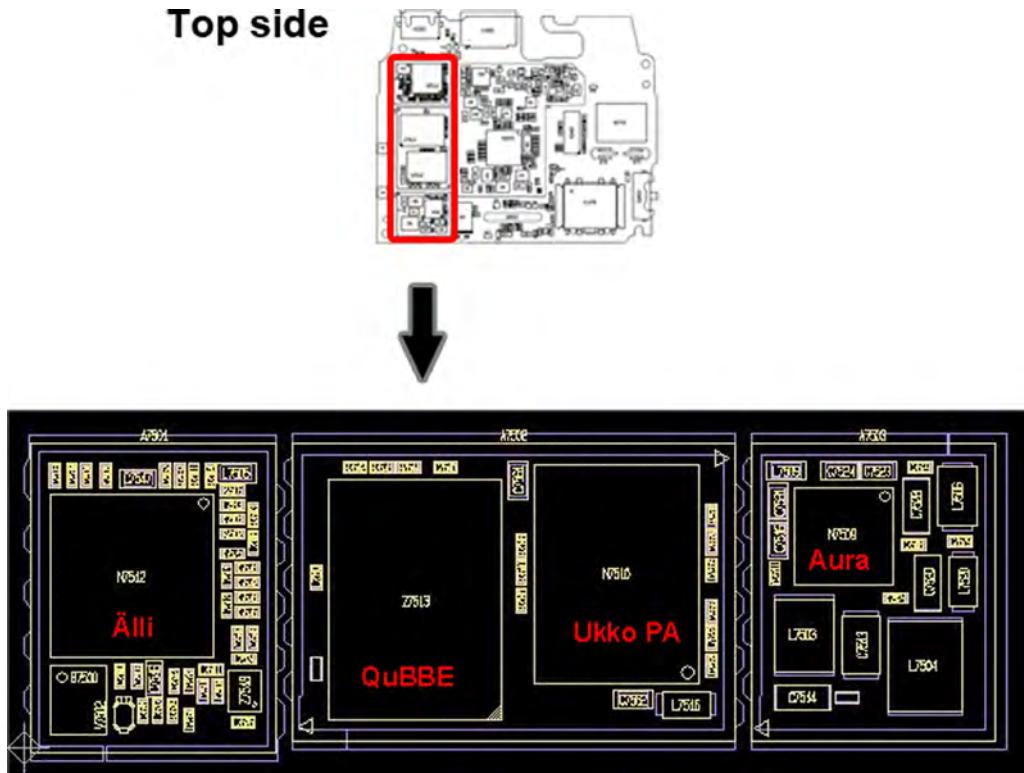

RF shield cans

Once a peel-off type RF shield can is opened, a repair lid (Nokia code 9501325) should always be installed. RF shielding does not work at all if RF shield cans are left open.

Level of repair

The scope of this guideline is to verify functionality of the cellular RF block as well as possible without removing RF shields.

■ Cellular RF key components

Linko RF has the following key components:

- Älli N7512 (Transceiver RF ASIC)
 - Aura N7509 (RF power management ASIC)
 - UKKO N7510 (Power amplifier, PA)
 - QuBBE Z7513 (Front end module)

Linko RF has separate RF shielding cans for:

- Älli N7512 + surroundings (Shield C)
 - QuBBE Z7513 + Ukko PA N7510 (Shield B)
 - Aura N7509 + surroundings (Shield A)

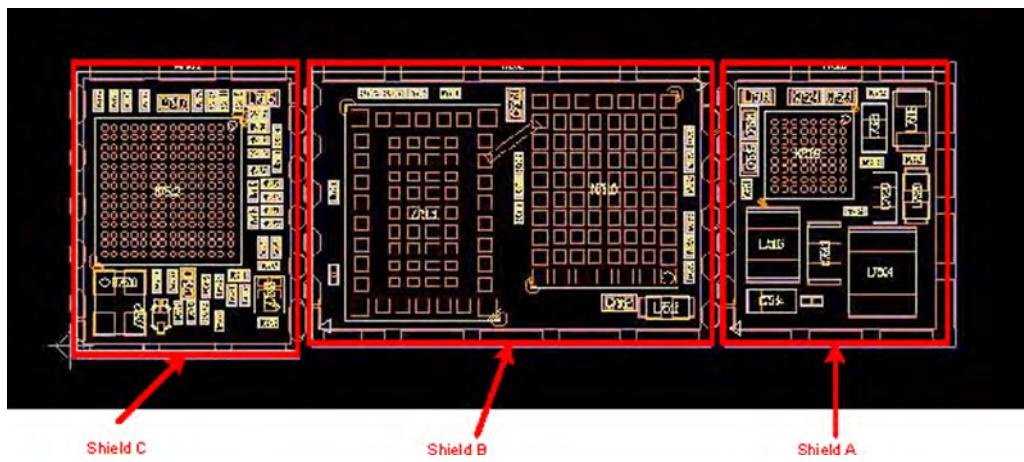

Figure 21 Linko shields

RF shield A is peel-off type and can be opened for repair purposes. The other two RF shield cans (B and C) are solid and should not be opened in service centers.

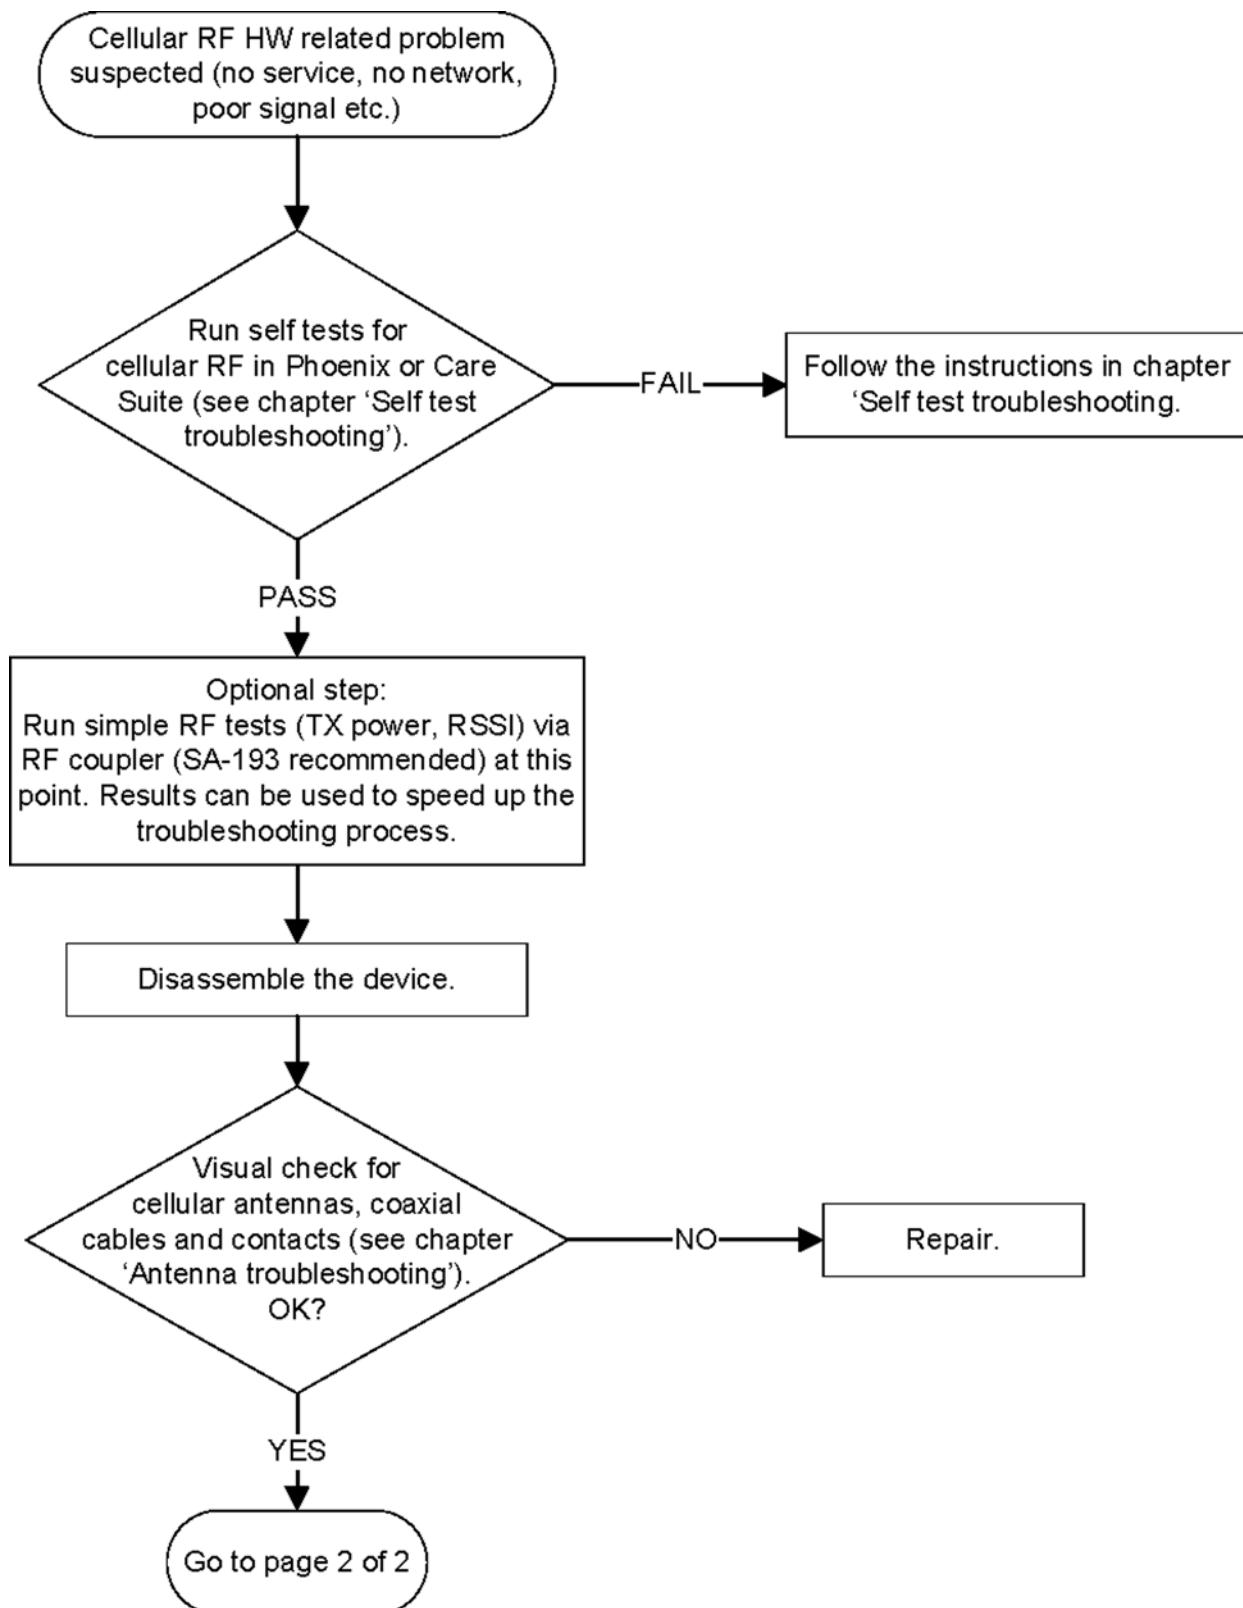

The maximum height of the shields is 1.70 mm.

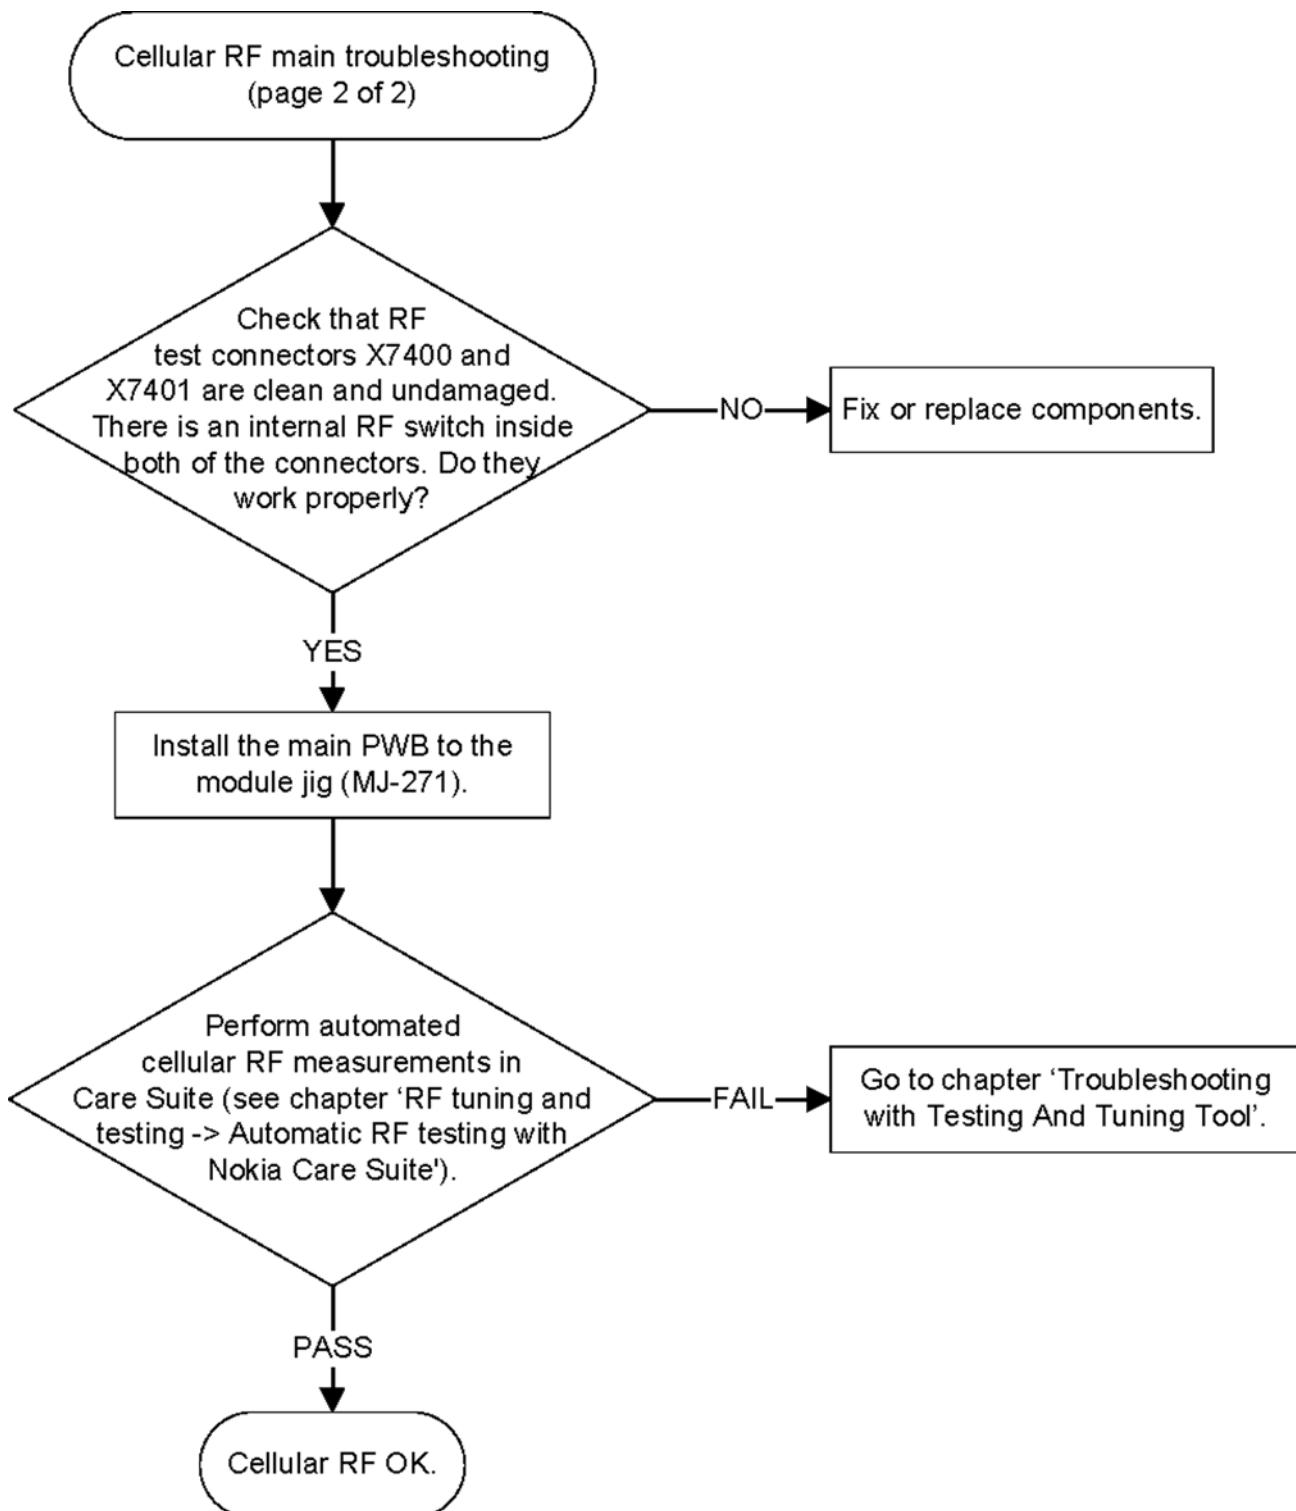

■ **Cellular RF main troubleshooting**

Cellular RF main troubleshooting

Context

Always start the cellular RF related troubleshooting procedure by following the diagram below.

Troubleshooting flow — Page 1 of 2

Troubleshooting flow — Page 2 of 2

Self test troubleshooting

Troubleshooting with RF self tests

Context

ÄLLI (N7512) RF ASIC contains test structures that can be used to detect certain RF related errors. In order to use these self tests the most efficient way, it is very important that the tests are performed in a certain order, or at least that the error data is analyzed in this order. The tests are designed so that by going through them in this order it is easy to find the problem component without any redundant checks. The flowcharts presented in this document are based on that idea.

The testing order recommended and used in this troubleshooting guide is the following:

1 ST_CDSP_RF_BB_IF test (ID hex. 56)

- Tests the functionality of the BB/Linko serial interface & reset lines.
- If this test fails, it means that there is a problem in programming of the N7512 and all of the following tests cannot give correct data.

2 ST_CDSP_RF_SUPPLY_TEST (ID hex. 53)

- Tests the functionality of N7512 bias block, regulators, reference voltage line and supply connections, as well as almost all Aura (N7509) regulator voltages..
- If this test fails, all other N7512 tests can/will fail.

3 ST_CDSP_DIGI_RXTX_IF_TEST (ID hex. 7D)

- Test checks that the digital RX and TX lines between BB and N7512 are properly connected.

4 ST_CDSP_STROBE_TEST (ID hex. 7C)

- Tests the functionality of the RFStrobe signal..

5 ST_CDSP_PA_ID_PIN_TEST (ID hex. 7F)

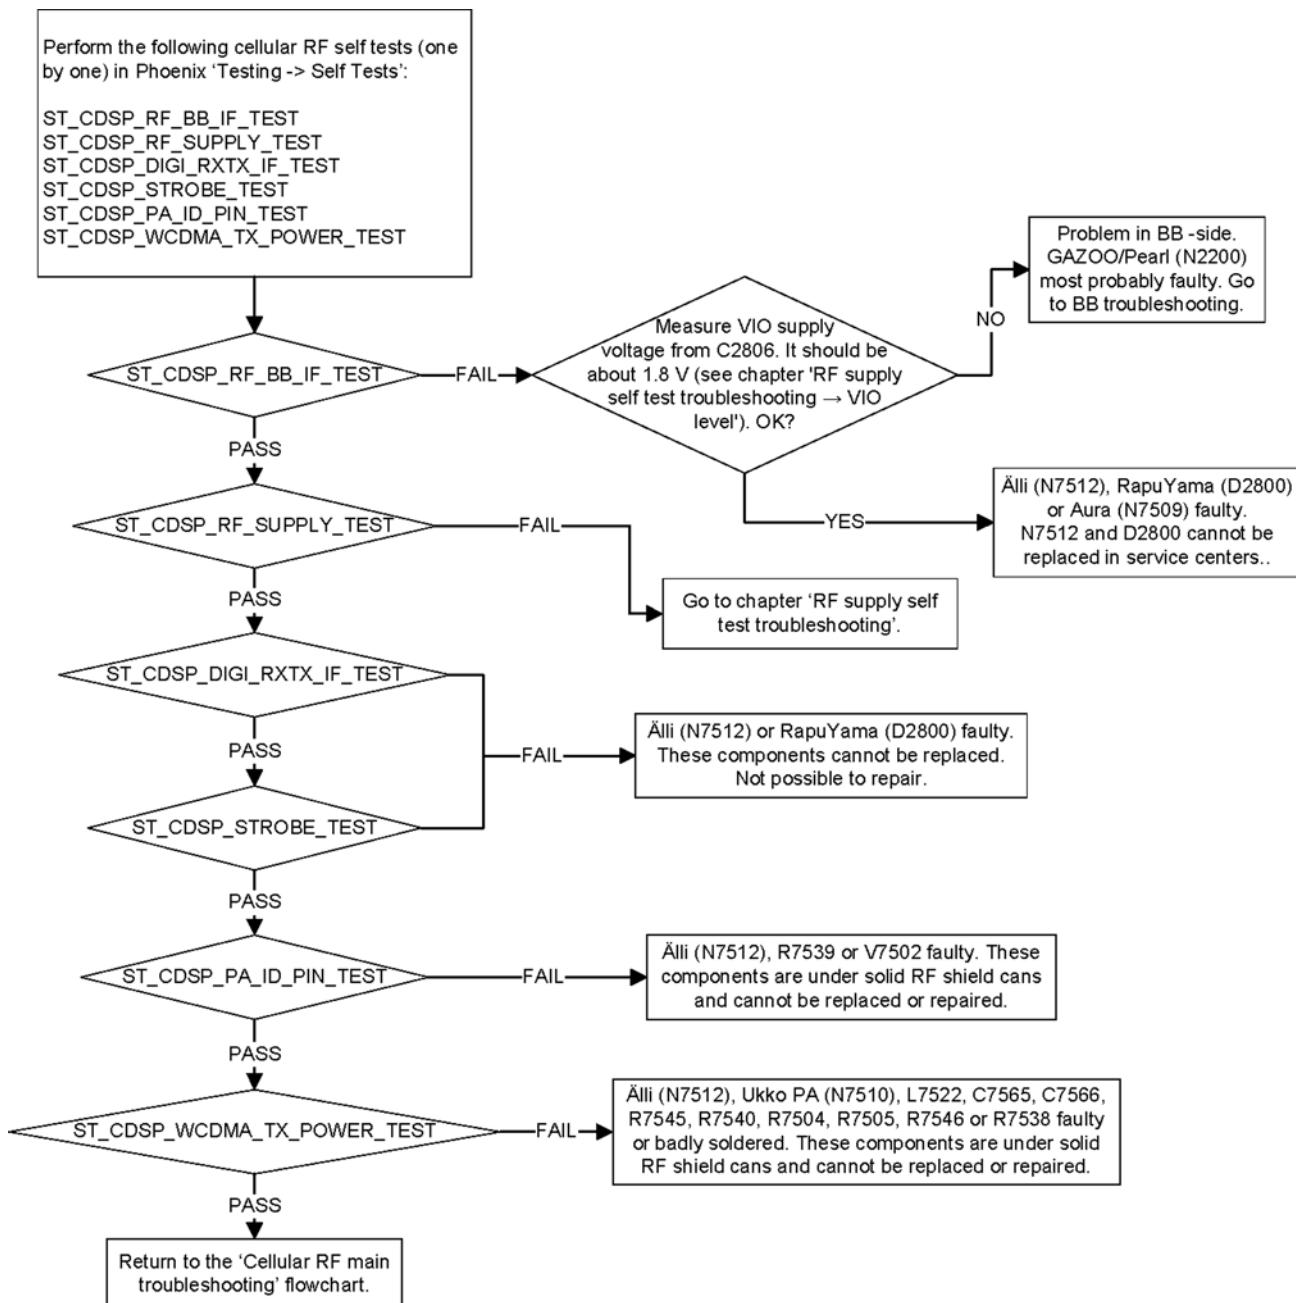

- The purpose of this test is to identify the PAs of the different vendors.
- Tests also the functionality of the temperature sensor V7502.

6 ST_CDSP_TX_WCDMA_POWER_TEST (ID hex. 4B)

- Tests the basic functionality of the WCDMA transmitter.

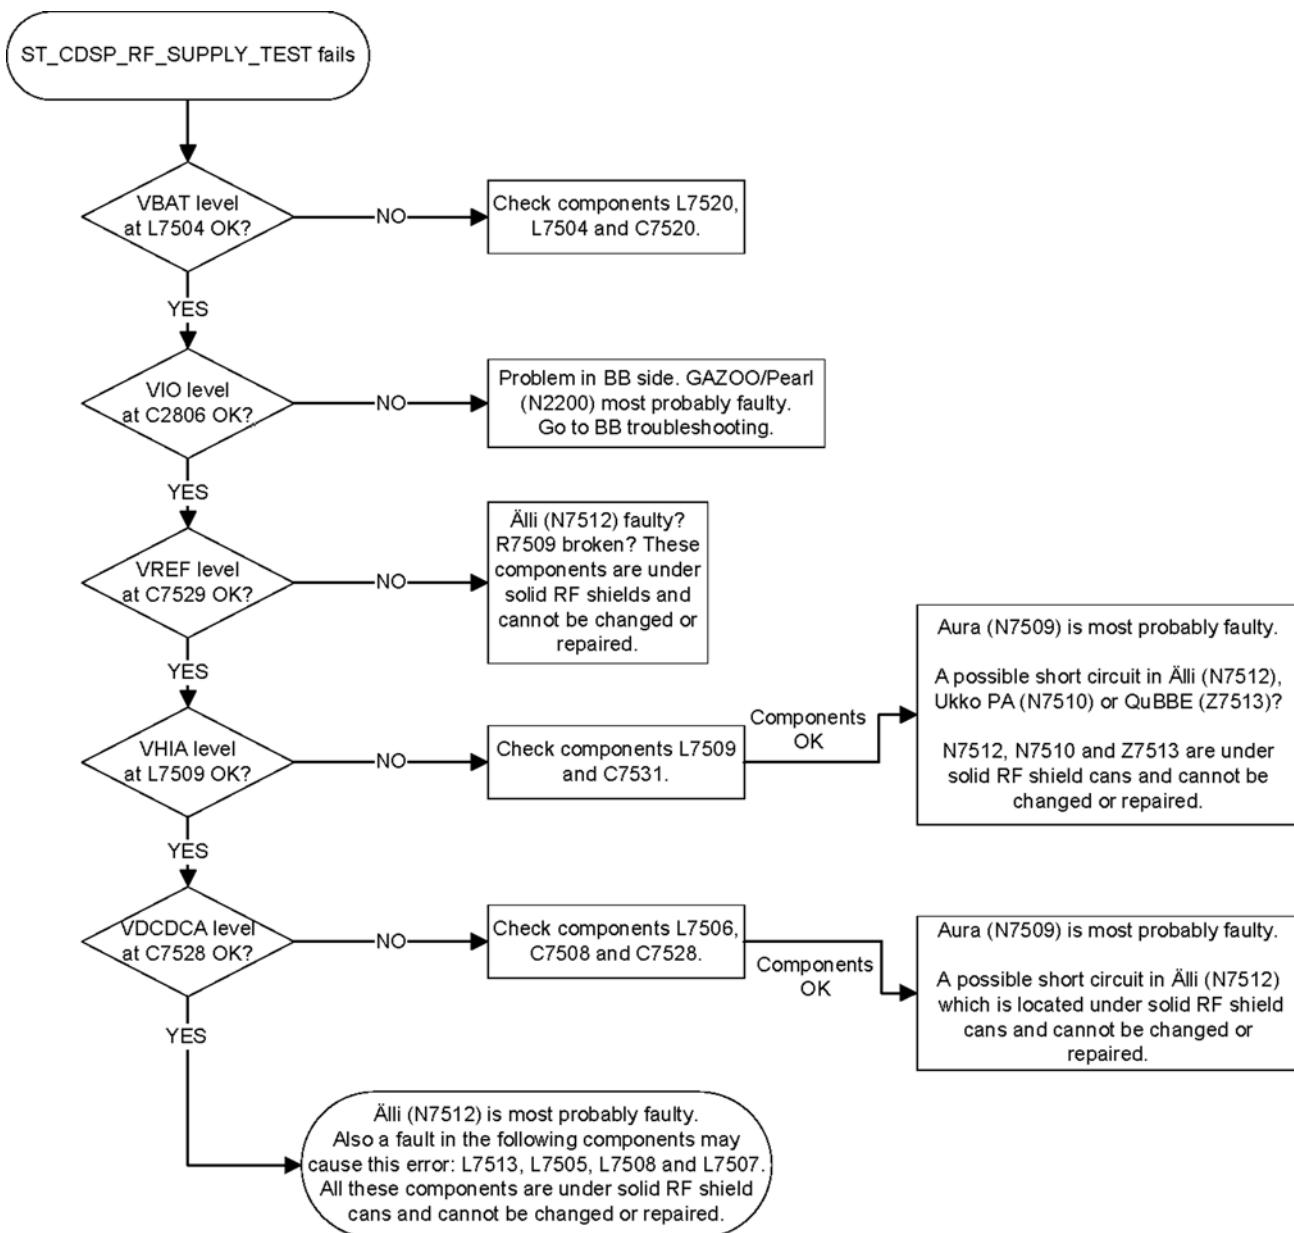

To get the best out of these instructions you need to have the valid schematics at hand.

Troubleshooting flow

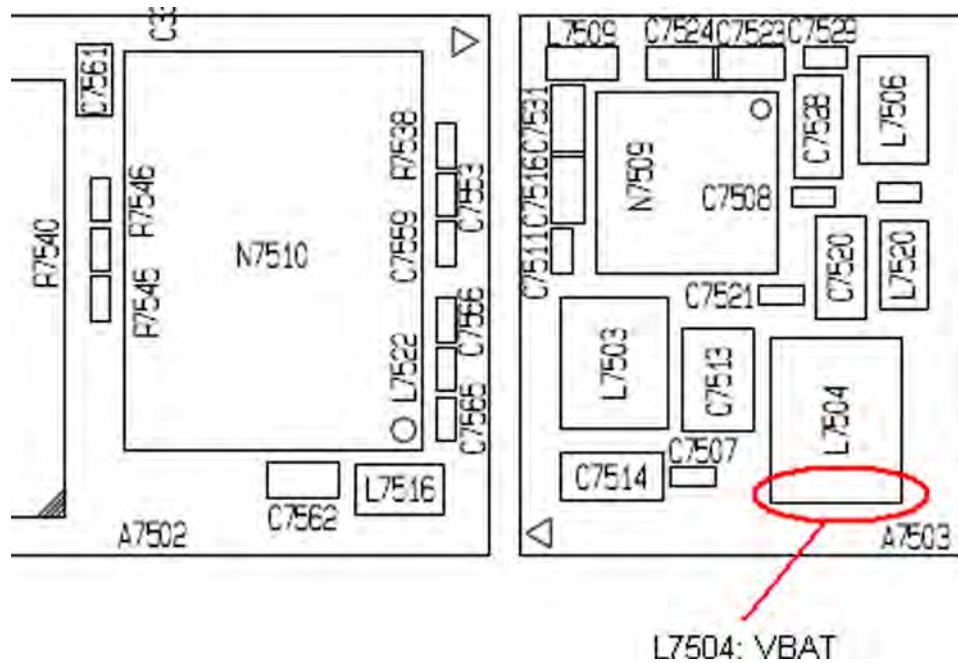

RF supply self test troubleshooting

Troubleshooting flow

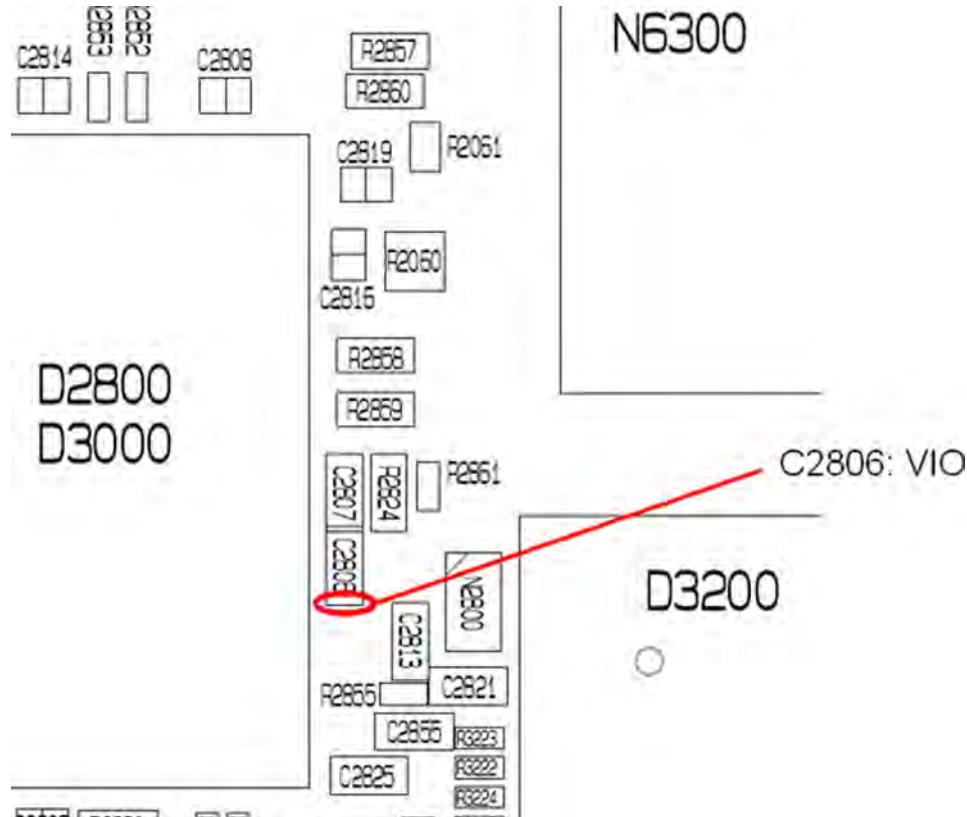

VBAT level

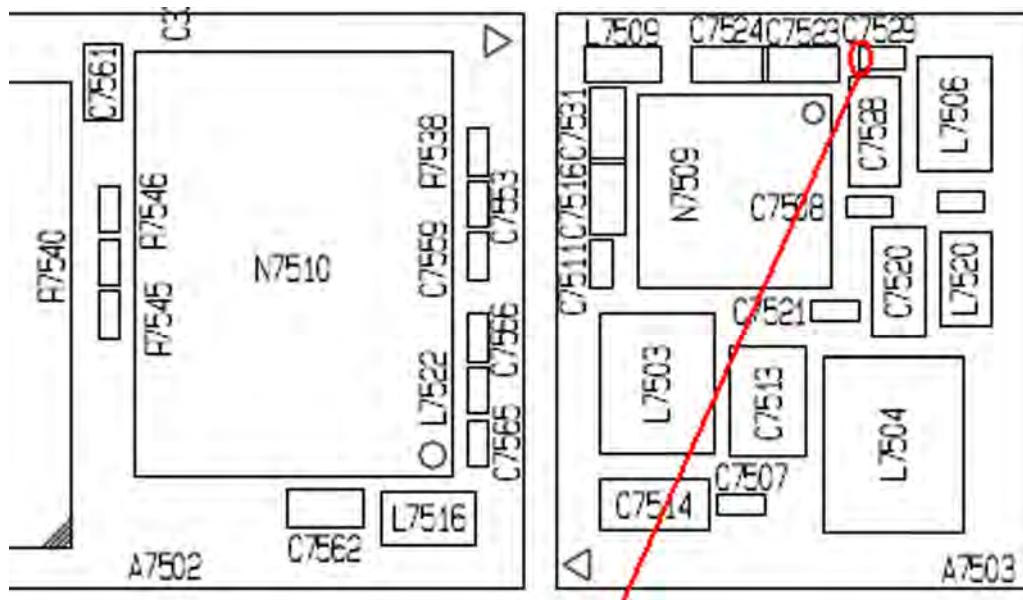

Check the VBAT level at the L7504. The level should be the same as the battery voltage and always on.

VIO level

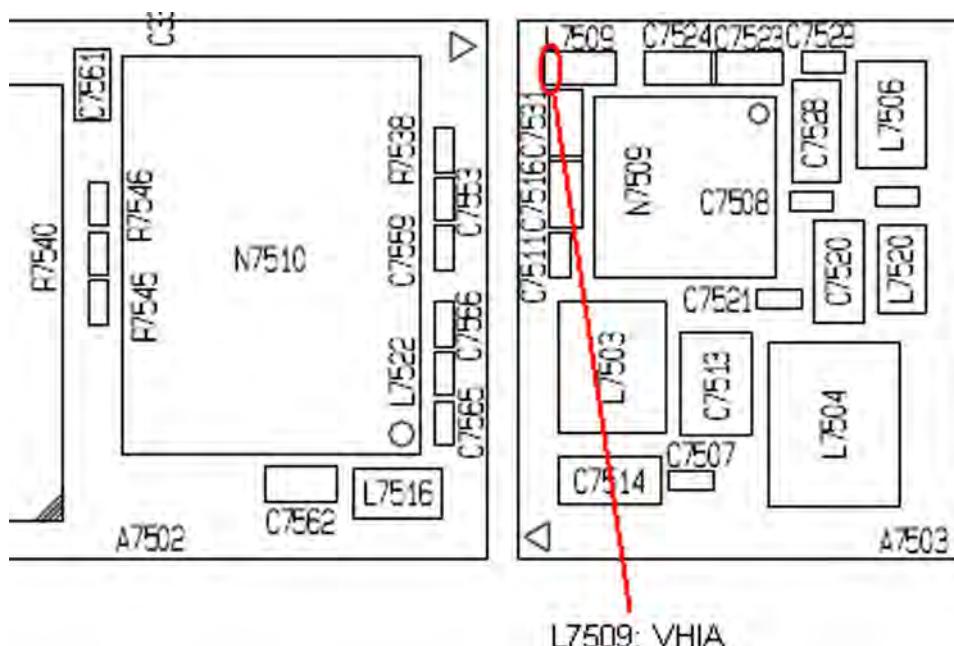

Check the VIO level (1.8V) at C2806. The signal is always on when the phone is in local mode.

VREF level

C7529: Vref

Check the Vref level (1.2 V) at C7529.

The GSM or WCDMA transmitter (or receiver) has to be activated before the Vref supply voltage can be measured. Follow the instructions given in chapter 'Manual transmitter (TX) testing with Phoenix → GSM transmitter activation' or 'WCDMA transmitter activation'.

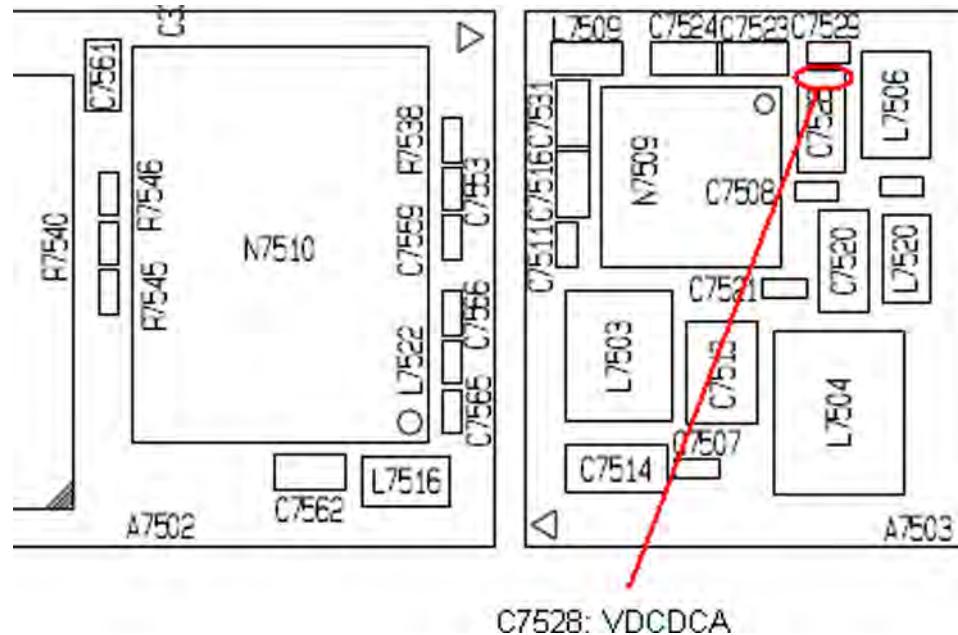

VHIA (Vhi) level

L7509: VHIA

Check the VHIA level (2.6 V) at L7509.

The GSM or WCDMA transmitter (or receiver) has to be activated before the VPA supply voltage can be measured. Follow the instructions given in chapter 'Manual transmitter (TX) testing with Phoenix → GSM transmitter activation' or 'WCDMA transmitter activation'.

VDCDCA (Vlow) level

Check the VDCDCA level (1.5 V) at C7528.

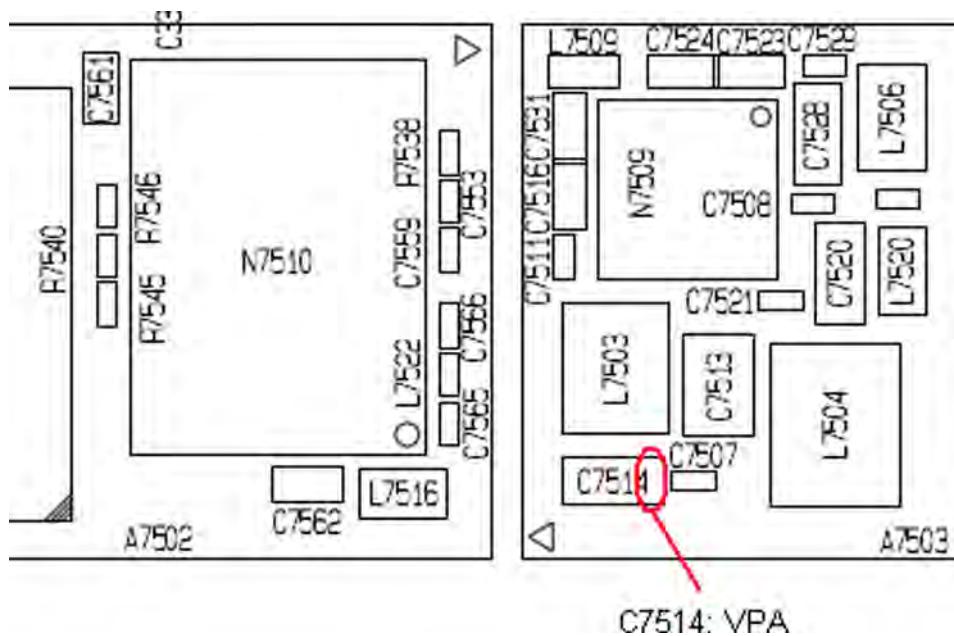

The WCDMA transmitter has to be activated before the VDCDCA supply voltage can be measured. Follow the instructions given in chapter 'Manual transmitter (TX) testing with Phoenix → 'WCDMA transmitter activation'.

Note: The VDCDCA signal is continuously on when WCDMA TX is activated.

VPA level

The GSM or WCDMA transmitter has to be activated before the VPA supply voltage can be measured. Follow the instructions given in chapter 'Manual transmitter (TX) testing with Phoenix → GSM transmitter activation' or 'WCDMA transmitter activation'.

Check the VPA voltage level at C7514.

In WCDMA mode, the voltage levels should be:

- 0.4...0.8 V @ Start level 0 dBm
- 0.8...1.3 V @ Start level 10 dBm
- 3.0...4.2 V @ Start level 24 dBm

In GSM mode, the voltage levels should be:

- 0.1...0.5 V @ GSM 900 & Tx Power Level 19
- 0.5...1.1 V @ GSM 900 & Tx Power Level 12
- 3.5...4.3 V @ GSM 900 & Tx Power Level 5

Note: The VPA signal is continuously on when WCDMA TX is activated, but has a pulsed nature in GSM TX mode (the signal is on only when a GSM TX burst is transmitted).

Note: The VPA signal is not tested by ST_CDSP_RF_SUPPLY_TEST.

■ RF tuning and testing

RF auto tuning and testing with Nokia Care Suite

Introduction to cellular RF tunings

RM-626 cellular RF engine has been tuned correctly in production. There is no reason to do re-calibration unless one or more of the RF components are changed or memory (D3000) is corrupted.

RM-626 can be tuned automatically. Auto tuning is designed to align the phone's RF part easily and faster. It performs calibrations, tunings and measurements of RX and TX. The results are displayed and logged in a result file, if initiated.

Note: Always perform RF tuning with the help of the module jig MJ-271, never with RF couplers. Using an RF coupler in the tuning phase will cause a complete mistuning of the RF part.

Important: After RF component changes, **always** perform cellular RF auto tuning.

Cable and adapter losses

RF cables and adapters have some losses. They have to be taken into account when the phone is tuned. As all the RF losses are frequency dependent, the user has to act very carefully and understand the measurement setup. For RF attenuations of the CA-158RS RF cable, please refer to section 'Service Tools and Service Concepts'.

Hardware set up

For hardware requirements for auto tuning, please refer to *RF testing and BB/RF tuning concept with module jig* in section 'Service Tools and Service Concepts'.

Nokia Care Suite preparations

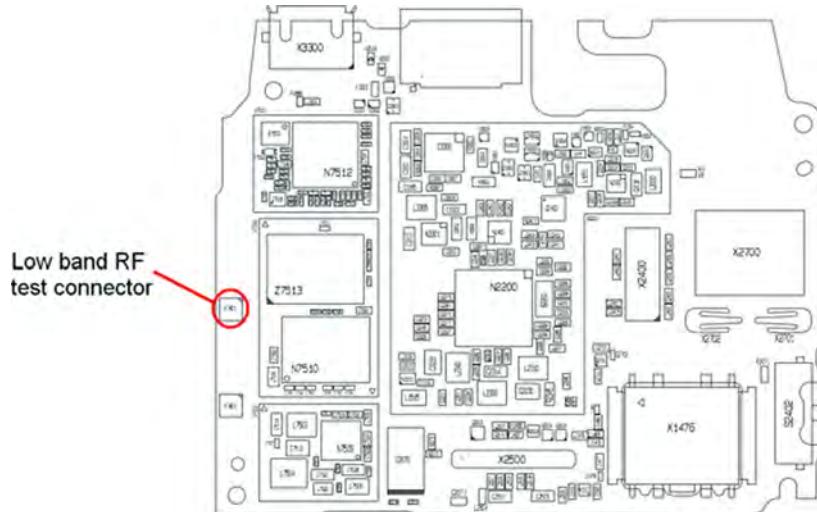

Install Testing And Tuning Tool add-on application to Nokia Care Suite. Automatic RF testing and tuning is not possible without this application. There is no more support in Phoenix to auto tune RM-626 product.

Install the phone specific data package, for example *Nokia_firmware_RM-626_EUROPE_10.014_v41.0.exe*. This defines phone specific settings.

RF auto tuning procedure

Note: If RF splitter is in use, skip steps 10, 11 and 12.

- 1 Make sure the phone (in the module jig) is connected to the PC.
 - 2 Connect the RF cable between the phone (low band antenna connector) and the communication tester. If an RF splitter is in use, connect both low and high band antenna cables.

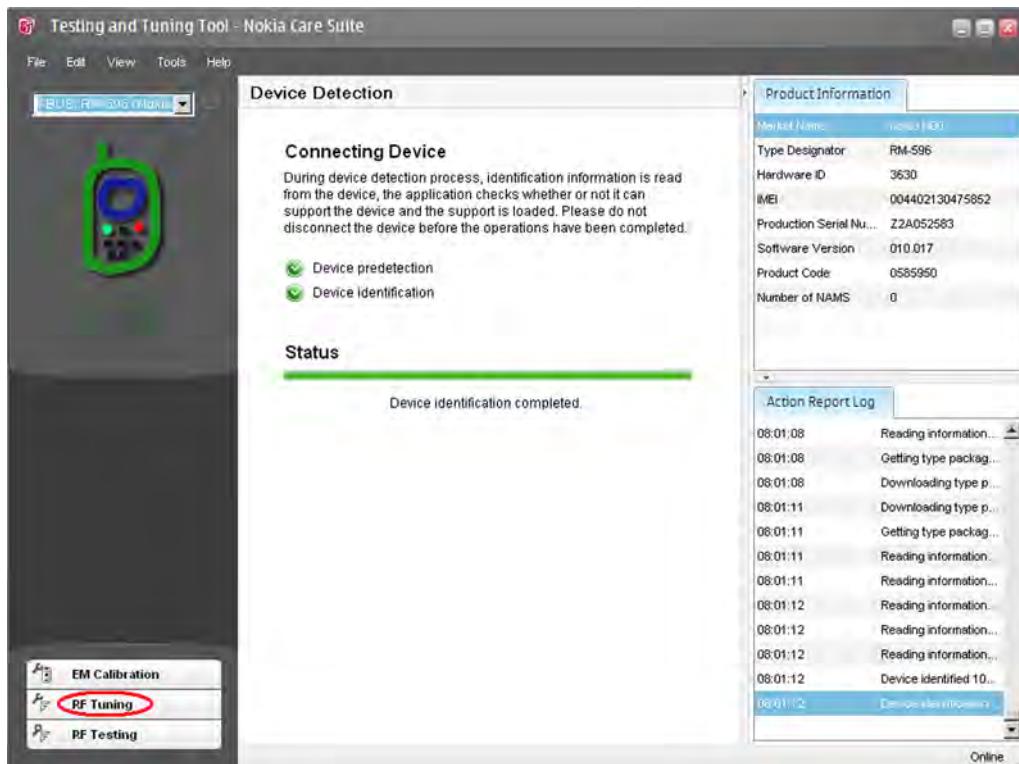

- 3 Start *Nokia Care Suite* application. The following window opens:

Note: The window appearance may differ depending on the *Nokia Care Suite* version.

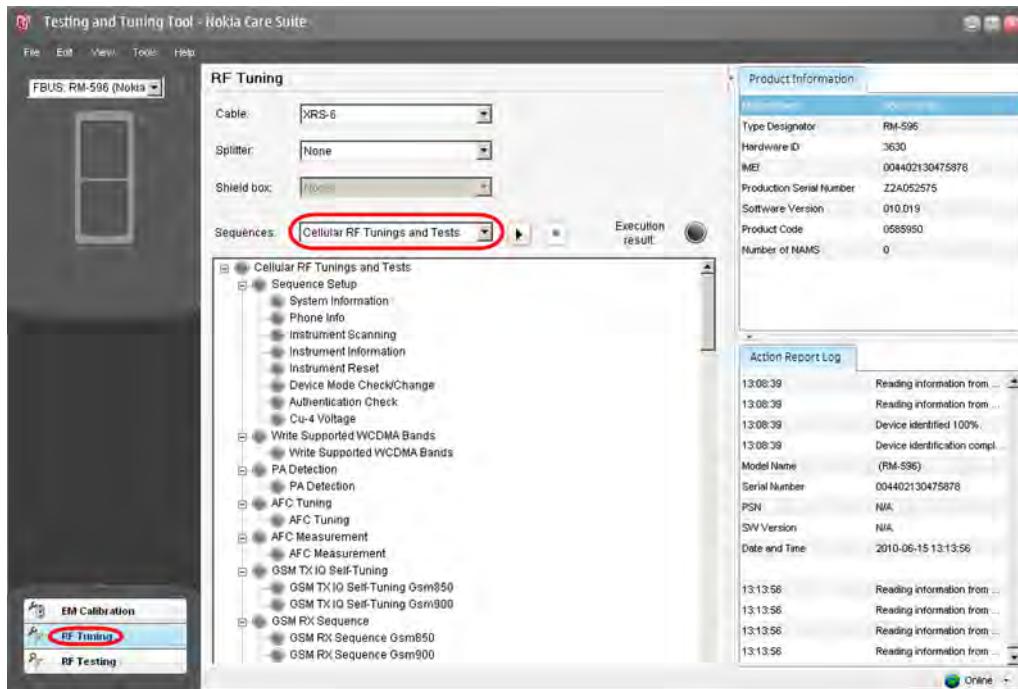

Note: *Fuse*, *Multi Software Updater*, *Product Support Tool For Store* and *Testing And Tuning Tool* are Care Suite add-on applications. The list is different if there are different add-on applications installed.

- 4 To open the application, double-click **Testing And Tuning Tool** icon.
- 5 If the application is able to find a connected phone, the following view will open:

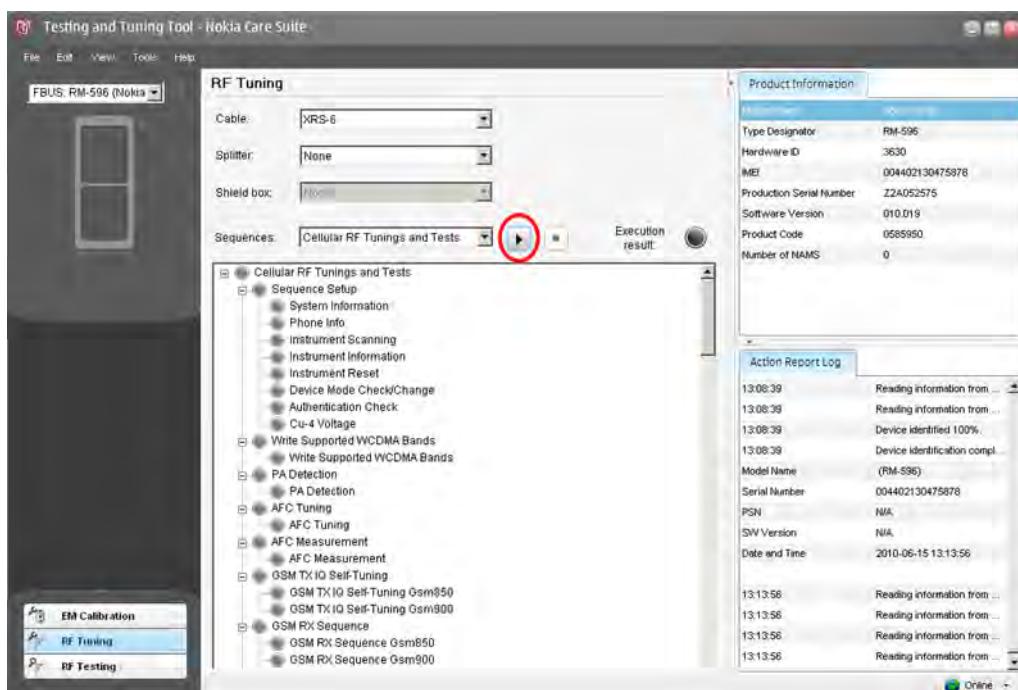

Note: The window appearance may differ depending on the *Nokia Care Suite* and *Testing And Tuning Tool*/versions

- Click on the **RF Tuning** button. The following view opens:

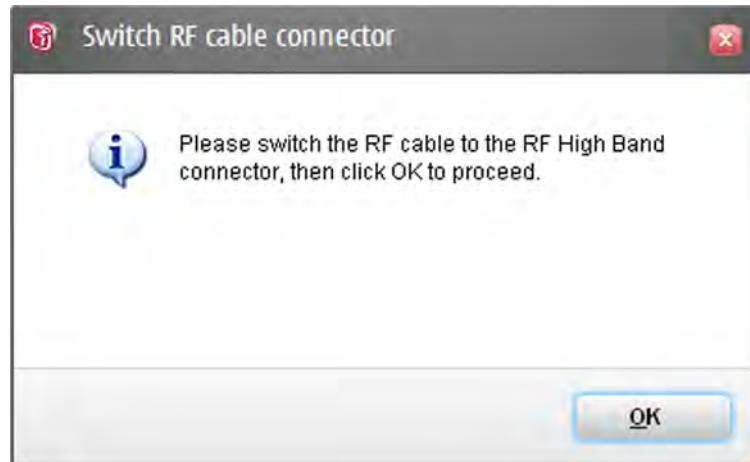

Note: The window appearance may differ depending on the *Nokia Care Suite* and *Testing And Tuning Tool*/versions

- Select **Cellular RF Tunings and Tests** from the drop-down menu.
- Select the RF cable used (and possible RF splitter / RF shield box) from the drop-down menu. CA-158RS attenuation values are always taken automatically into account when RM-626 product is connected to *Nokia Care Suite* tool.
- Click the **Run** button.

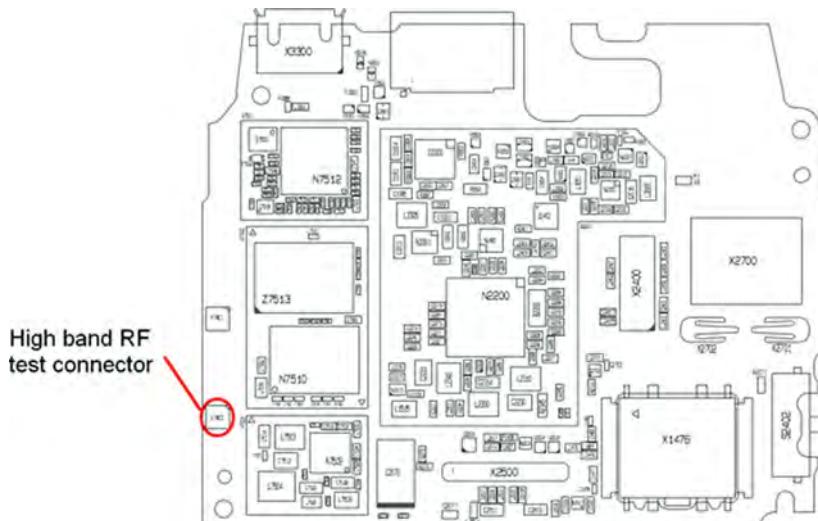

Note: The window appearance may differ depending on the *Nokia Care Suite* and *Testing And Tuning Tool*/versions

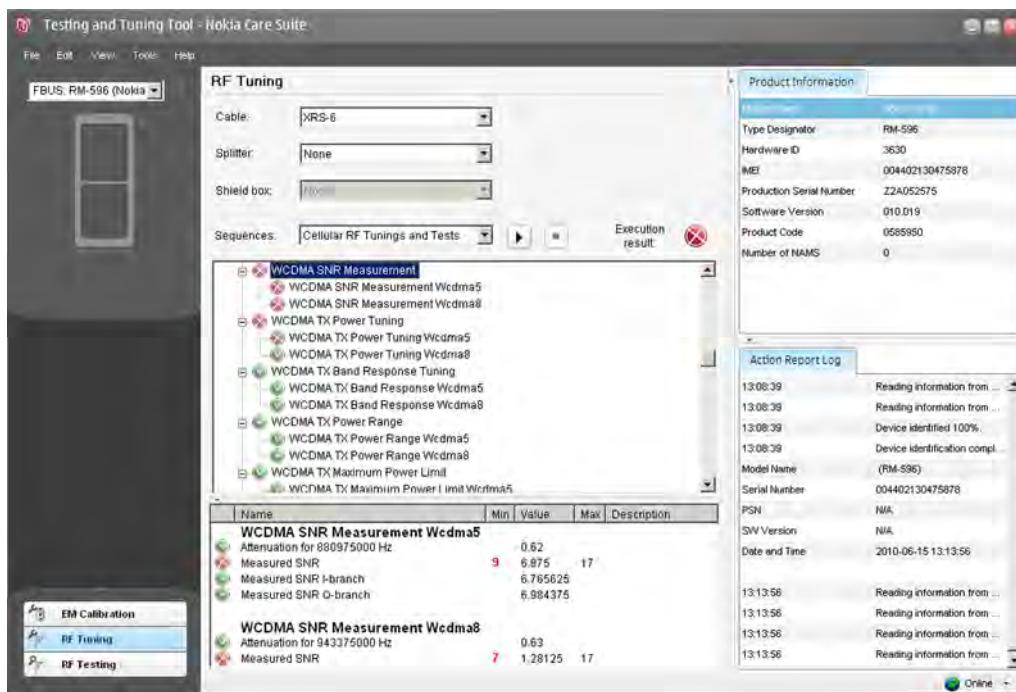

- 10 If no critical errors happen during the low band RF tuning procedure, the following window will pop up:

- 11 Change the CA-158RS cable to the high band RF connector on the phone PWB.

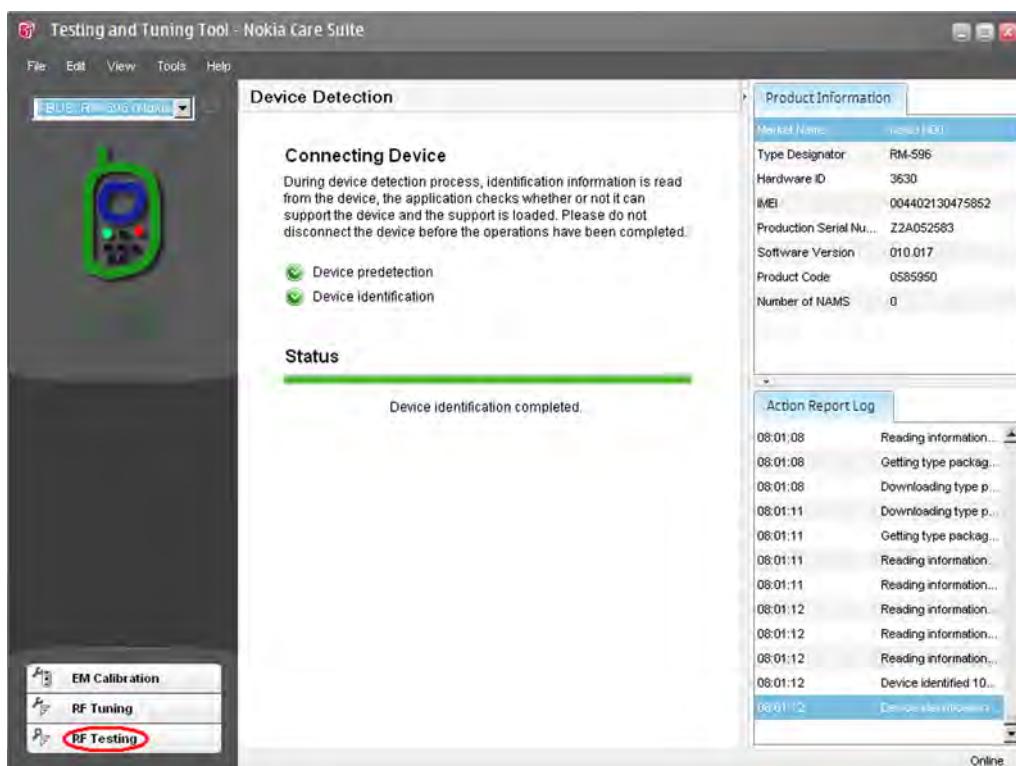

- 12 Click **OK** and RF tunings will automatically be performed for high cellular bands.
- 13 RF tunings will be ready when all the tunings and measurements are green in the tool window and no errors occur.
- 14 If errors do happen, failed tuning/testing steps are marked with a red color and more detailed results are shown on the screen. An example fail case is shown below:

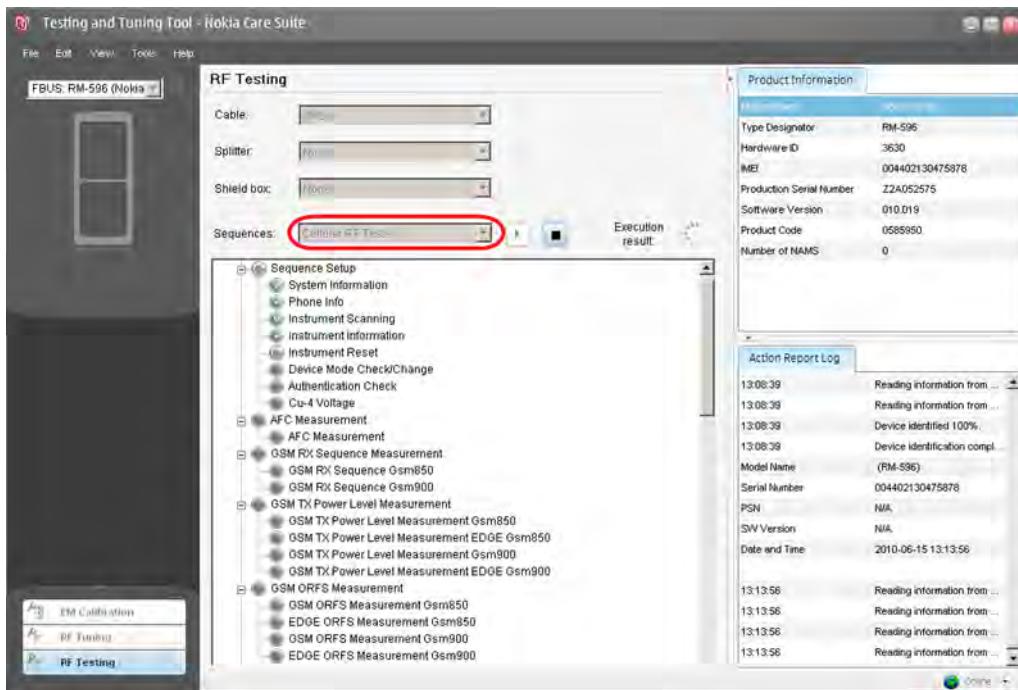

Note: The window appearance may differ depending on the *Nokia Care Suite* and *Testing And Tuning Tool*/versions

Automatic RF testing with Nokia Care Suite

Testing And Tuning Tool/add-on application can be used also for non-signalling RF tests. The automatic RF testing procedure is the same as explained in the chapter *RF auto tuning procedure*, but **RF Testing** should be selected in the *Testing And Tuning Tool*/main window instead of **RF Tuning**.

Note: The window appearance may differ depending on the *Nokia Care Suite* and *Testing And Tuning Tool*/versions.

RF Testing selection does all the same measurements as **RF Tuning**, but does not perform any tunings. **RF Testing** is a safe way to check the basic cellular RF performance of the phone. The following test cases will be performed (the complete set of measurements may differ depending on the data package content):

- GSM SNR
- GSM RSSI
- GSM / EDGE TX Power Level
- GSM Modulation & Switching spectrum
- GSM EDGE EVM
- GSM Burst Template
- GSM Phase Error
- WCDMA RSSI
- WCDMA SNR
- WCDMA TX Power Range
- WCDMA TX Max Output Power
- WCDMA ACP
- WCDMA EVM

Troubleshooting with Testing And Tuning Tool

Context

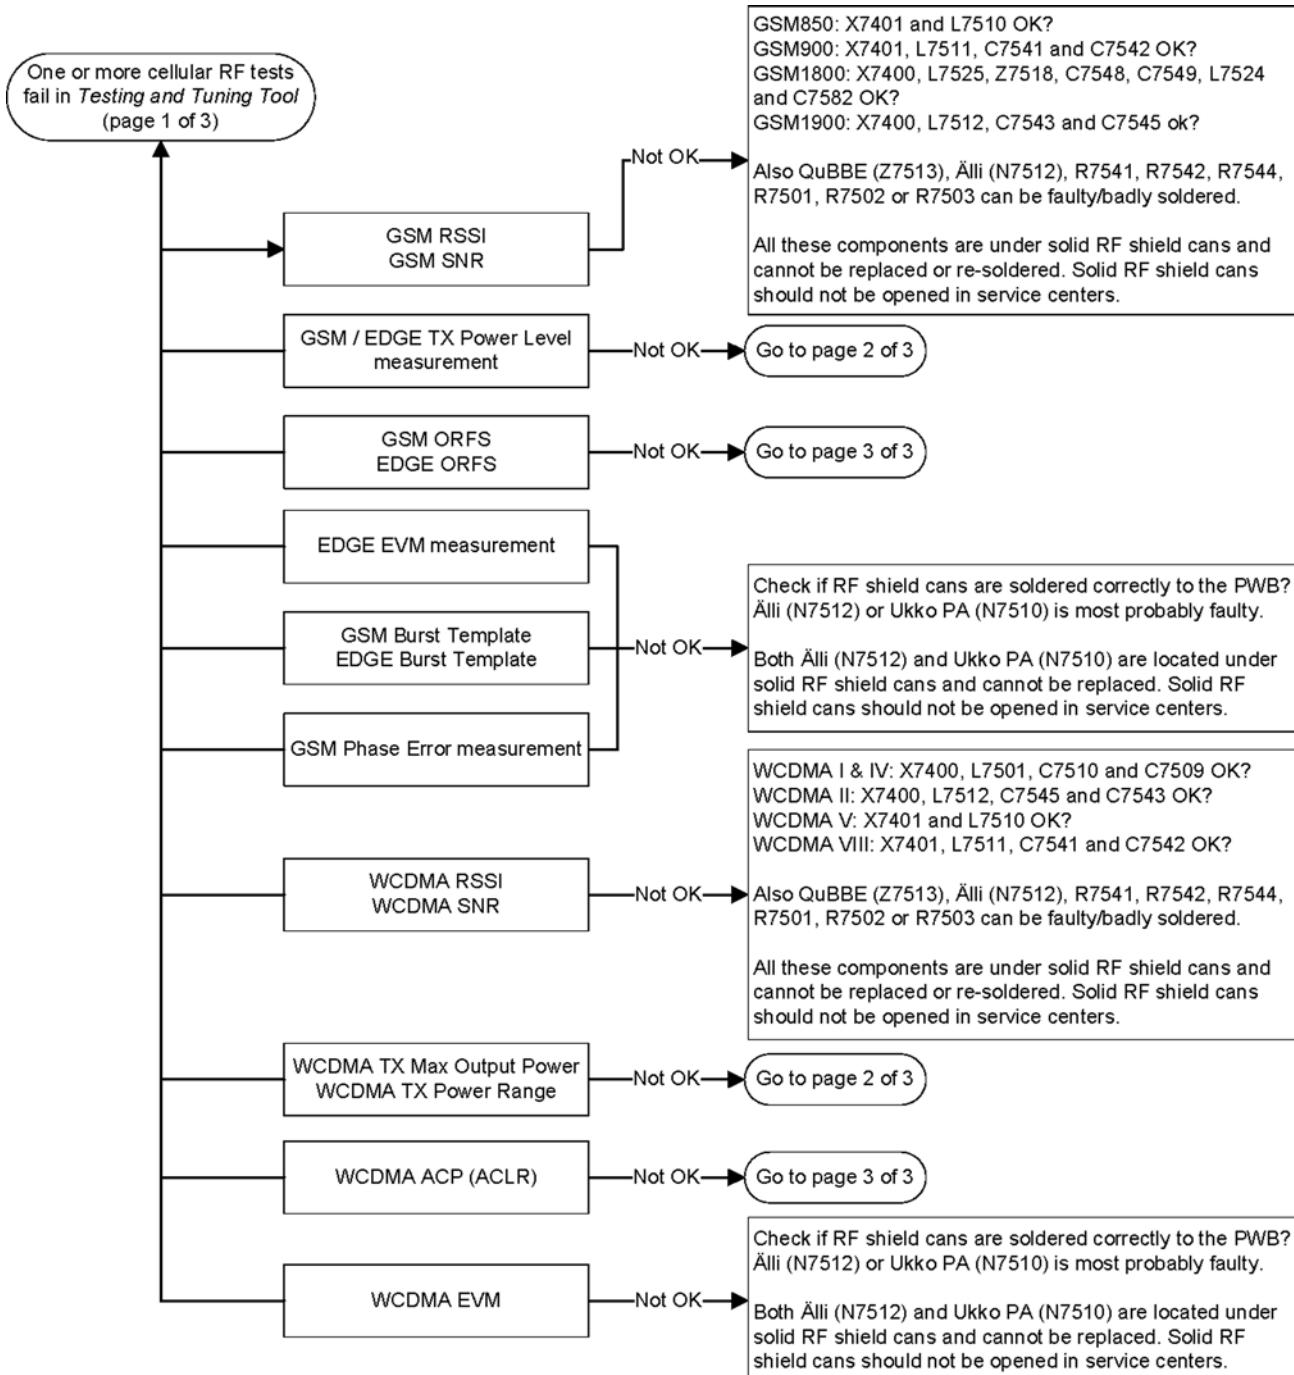

If limit fails occur while RF tests are performed with Testing And Tuning Tool, the user has to be very careful to understand the measurement results. Fails may occur because of many reasons:

- 1 RF attenuation between the phone and the communication tester is something else as expected by the *Testing And Tuning Tool*. Please check that cable, splitter and shield box selections are correct in the *Testing And Tuning Tool*/main window.

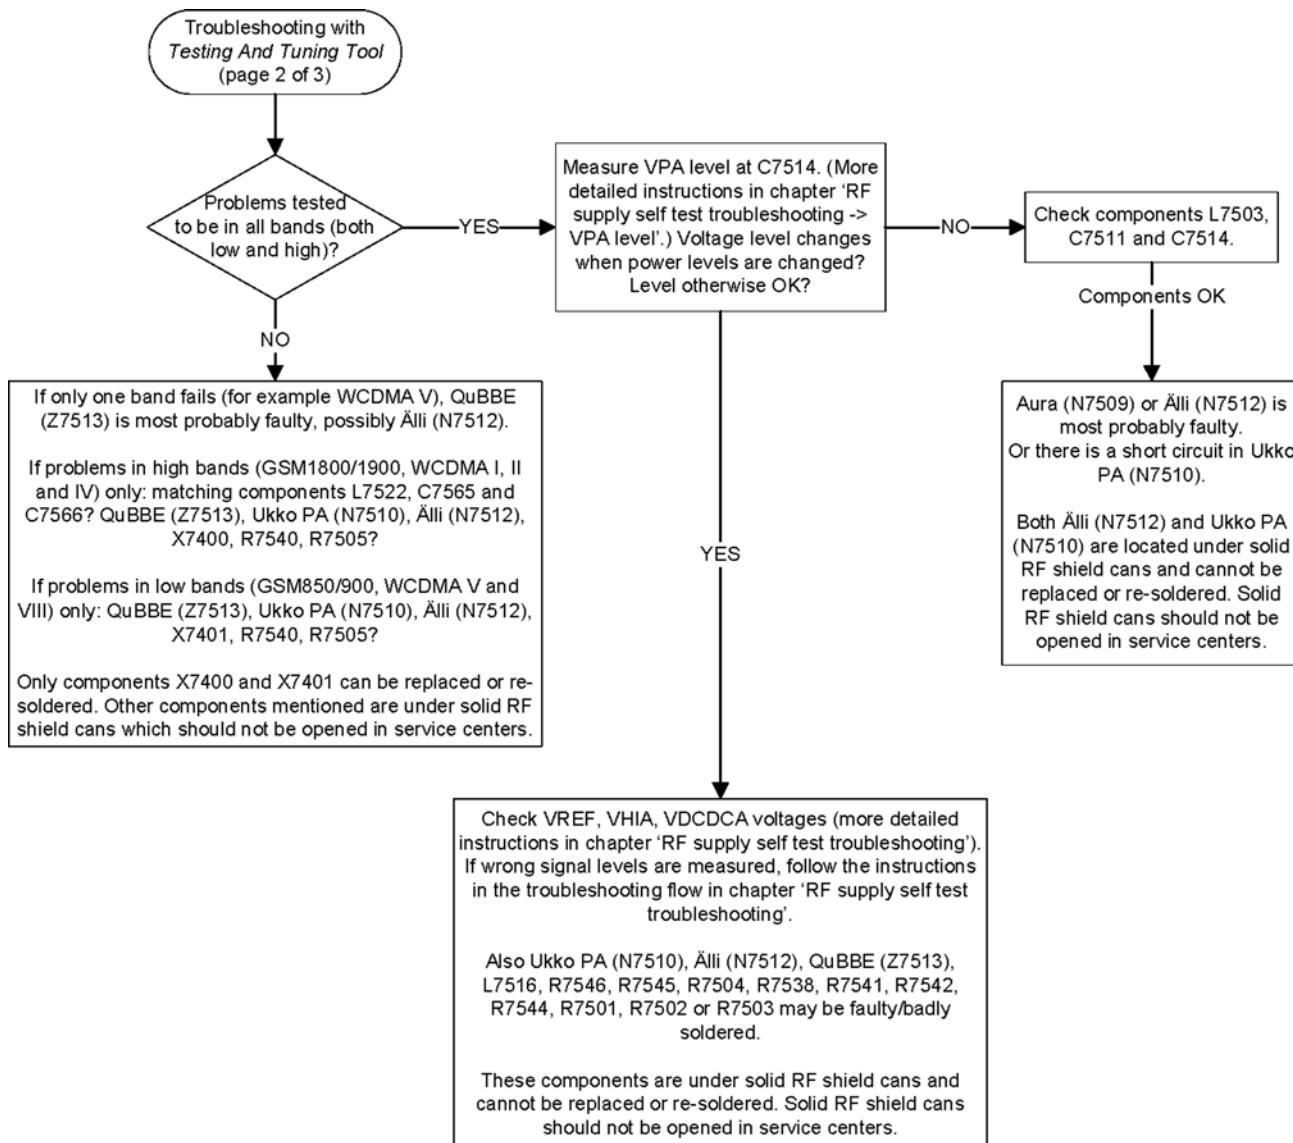

- 2 Test limits (specified in the product specific data package) are quite tight. Small limit violations do not always mean that the tested product is broken, but the RF performance may not be as good as it should be.
- 3 RX measurements (RSSI, SNR) may fail because of strong signals from base stations nearby. It is recommended to always perform RF measurements in an RF-shielded environment (in an RF-shield box or room).
- 4 The phone is really broken and needs more specific troubleshooting. Typical for these cases is that *RF Testing* gives measurement results which are far from the test limits.

Note: Start the more specific troubleshooting always from the chapter *Cellular RF main troubleshooting*. The troubleshooting flow below may be misleading if followed without upper level instructions.

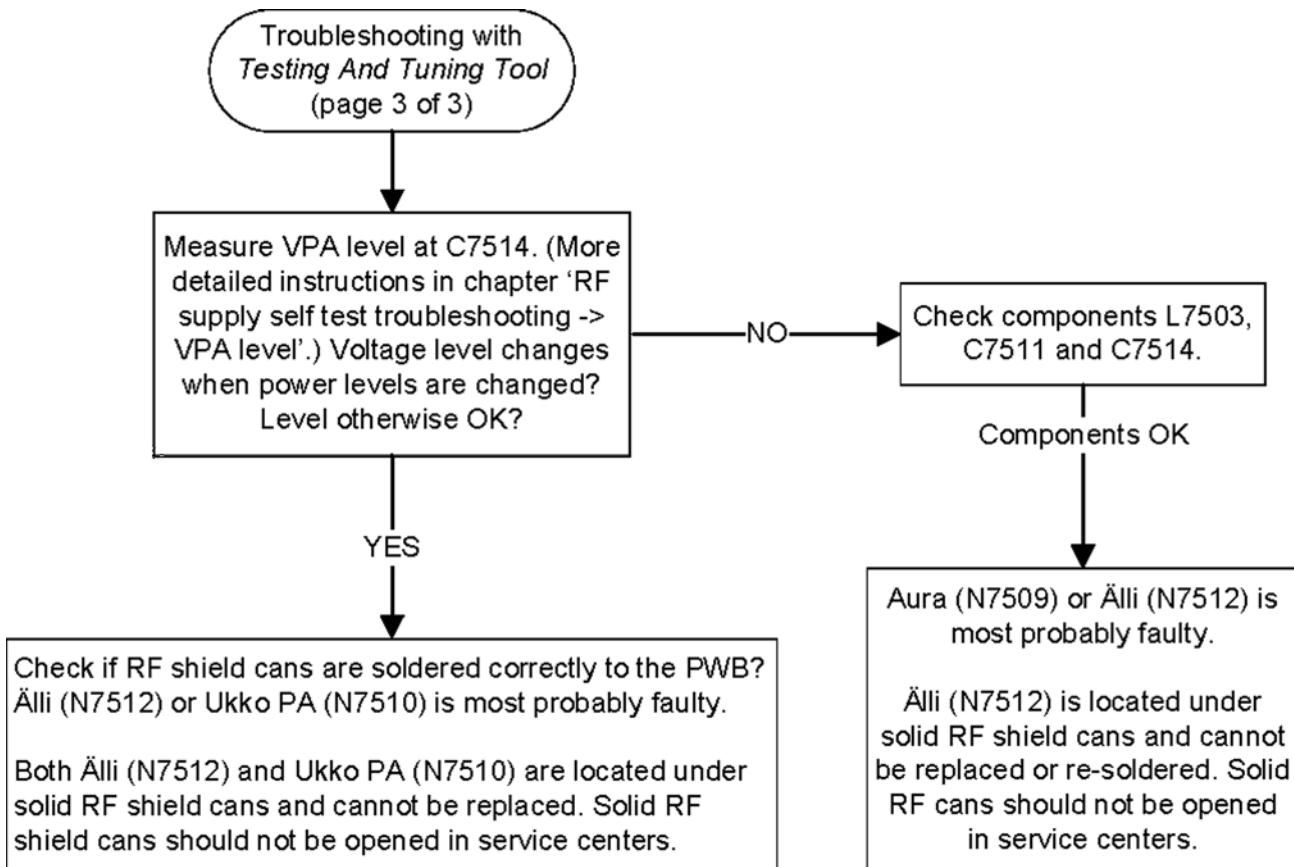

Troubleshooting flow — Page 1 of 3

Troubleshooting flow — Page 2 of 3

Troubleshooting flow — Page 3 of 3

Manual transmitter (TX) testing with Phoenix

General instructions for transmitter (TX) activation

Please note the following before performing transmitter tests:

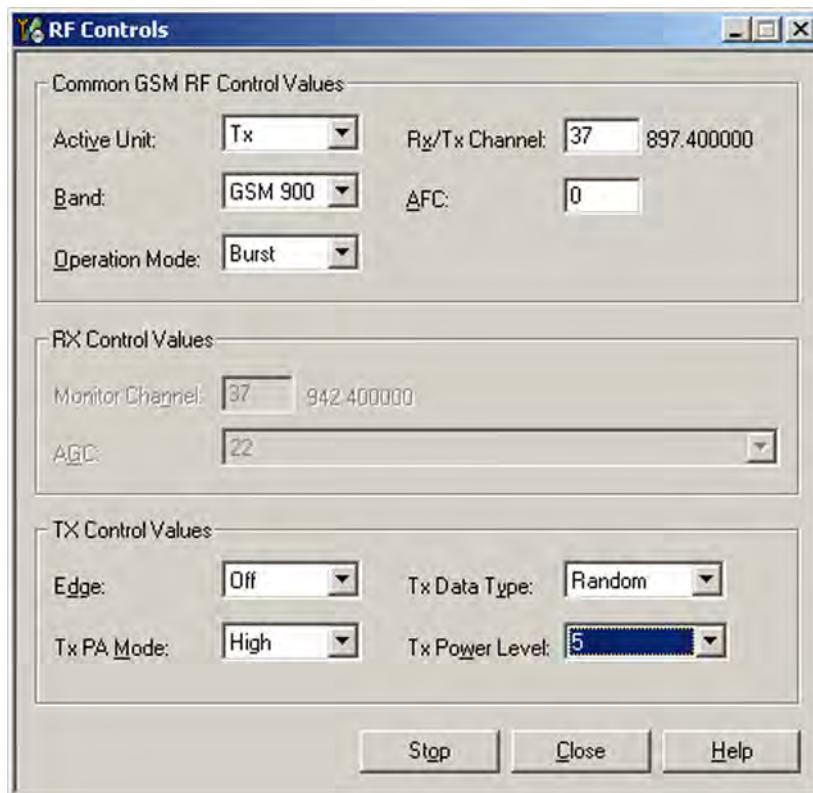

- TX troubleshooting requires TX operation
- Do not transmit on frequencies that are in use
- The transmitter can be controlled in local mode for diagnostic purposes
- The most useful Phoenix tool for GSM transmitter testing is "RF Controls", in WCDMA transmitter testing the best tool is "TX Control"

Note: Never activate the GSM or WCDMA transmitter without a proper antenna load. Always connect a 50 Ω load to the RF connector (antenna, RF measurement equipment or at least a 2 W dummy load), otherwise the power amplifier (PA) may be damaged.

GSM transmitter activation

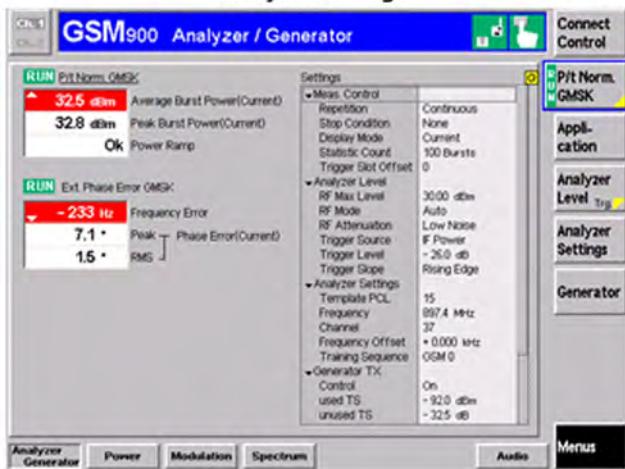

Steps

1. Set the phone to local mode.
2. Activate the RF controls tool in Phoenix (**Testing → GSM → RF Controls**).
3. Make settings as shown in the figure:

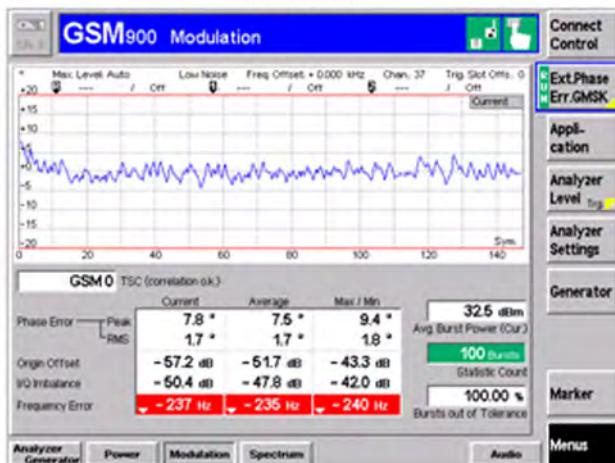

4. GSM transmitter is activated when **Active Unit** is set to "Tx". Aura (N7509) supply voltages are on for measurement purposes after this step is completed.
5. *Optional step (not needed if GSM TX activation only required):* Check the basic TX parameters (i.e. power, phase error, modulation and switching spectrum) manually, using a communication analyzer (for example CMU-200). Change power level (in "RF Controls" tool) and make sure the power reading follows accordingly.

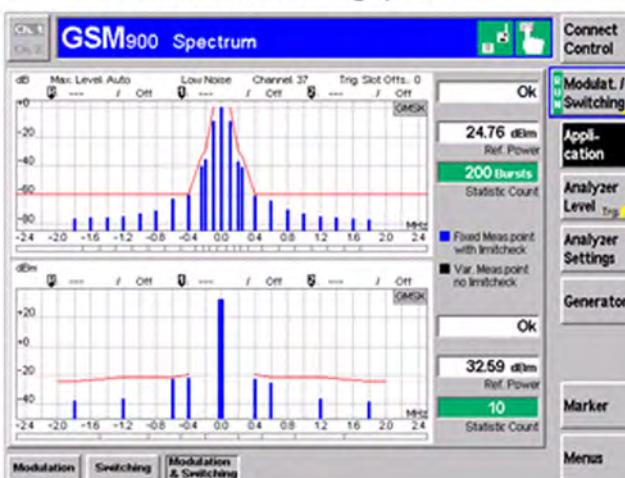

Analyser settings

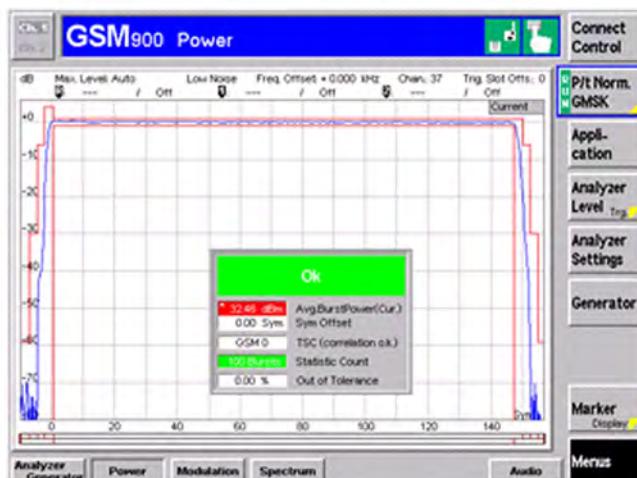

Phase error

Modulation/Switching spectrum

Power/Burst GSM/GPRS (GMSK)

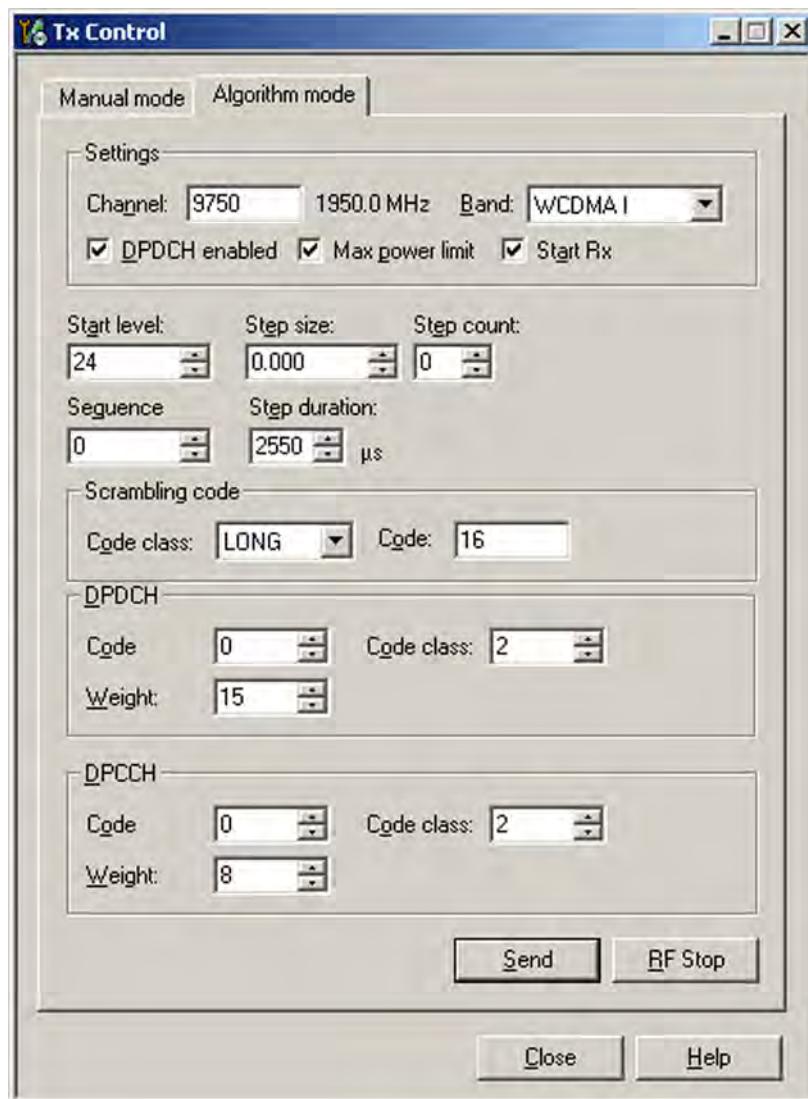

Power/Burst - EDGE (8PSK)

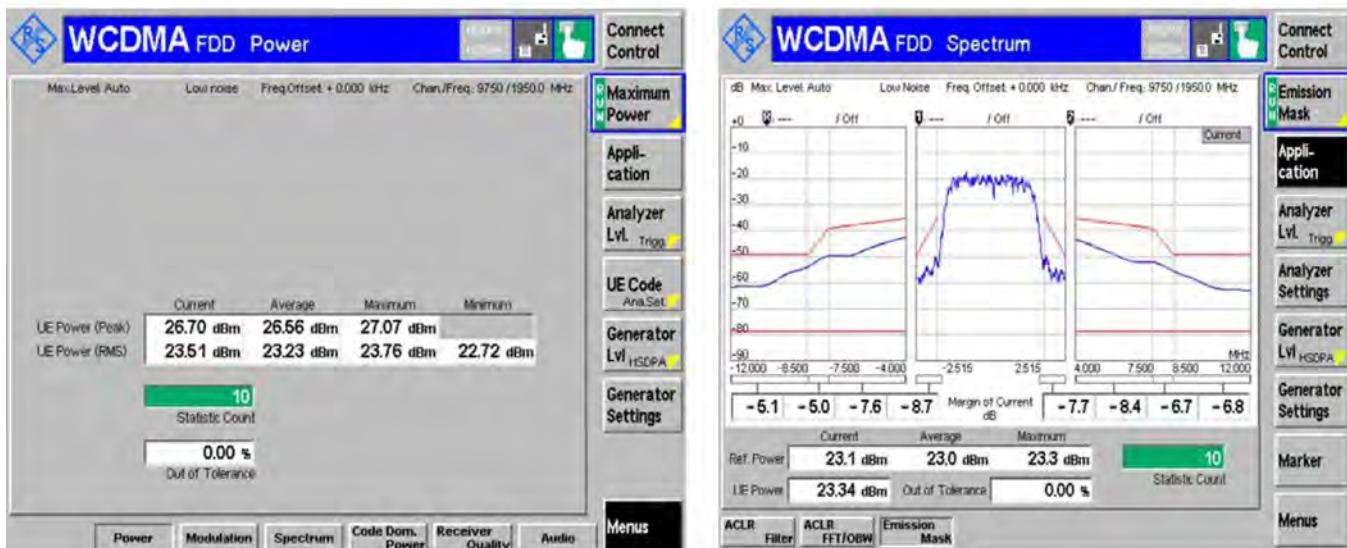

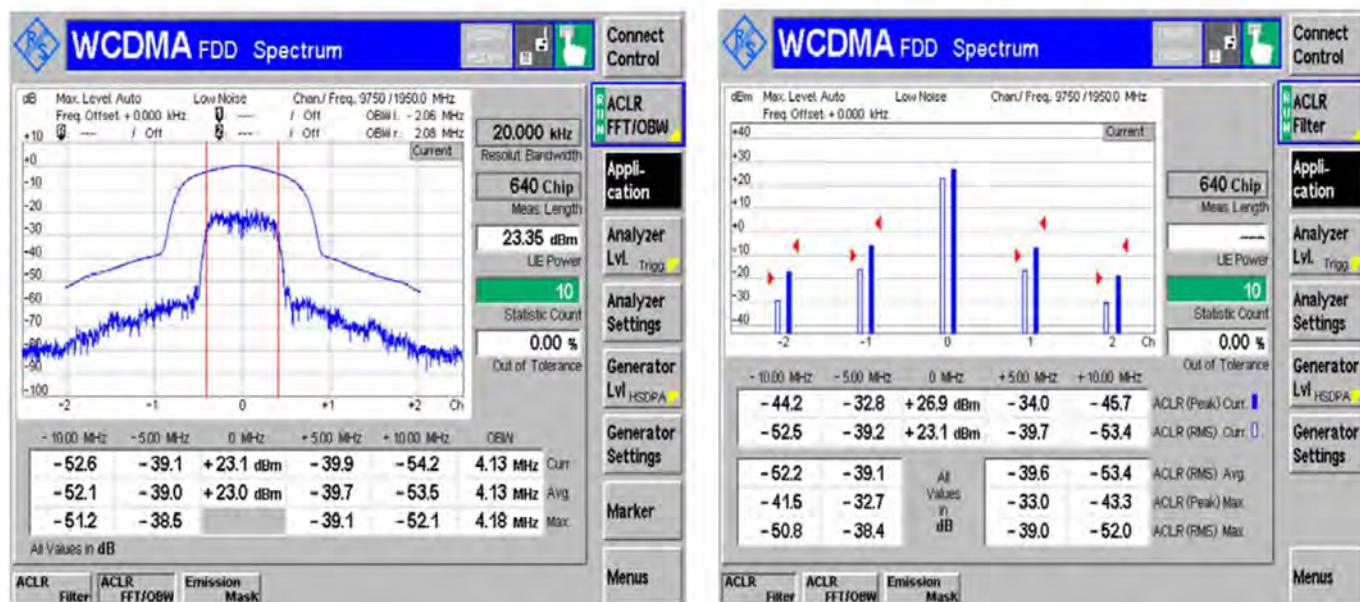

WCDMA transmitter activation

Steps

1. Set the phone to local mode.
2. In Phoenix, select **Testing** → **WCDMA** → **TX Control**.
3. Select **Algorithm mode** tab.
4. In the TX Control window, make settings as in the figure:

5. Click **Send** to enable the settings and activate TX. If settings are changed (e.g. new channel or power level), you have to click **RF Stop** and **Send** again. Aura (N7509) supply voltages are on for measurement purposes after this step is completed.
6. *Optional step (not needed if WCDMA TX activation only required):* Check the basic TX parameters using a communication analyzer (for example CMU-200).

Power
Spectrum - Emission Mask

Spectrum - ACLR (FFT/OBW)
Spectrum - ACLR (Filter)

Manual receiver (RX) testing with Phoenix
General instructions for manual receiver testing

RX can be tested manually by making a phone call or in local mode. For the local mode testing, use Phoenix service software.

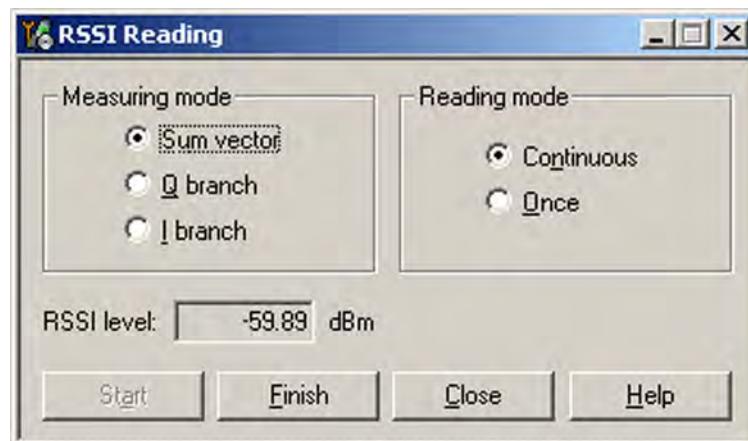

The most important RX measurement in local mode is RSSI reading. This test measures the signal strength of the received signal. For GSM RSSI measurements, see chapter *GSM RX chain activation for manual measurements/GSM RSSI measurement*. For a similar test in WCDMA mode, see chapter *WCDMA RSSI measurement*.

GSM RX chain activation for manual measurements/GSM RSSI measurement**Prerequisites**

Connect a signal generator to a proper RF connector on the phone PWB (note: there are two antenna connectors for cellular RF on the phone PWB, one for low bands and one for high bands).

Steps

1. Set the phone to local mode.
2. Activate GSM RSSI reading in Phoenix (**Testing → GSM → RSSI Reading**)

3. Use the following frequencies and RF levels in RF generator for different GSM bands:

Setting	GSM850	GSM900	GSM1800	GSM1900
Phoenix: <i>Monitor Channel</i>	190	37	700	661
RF frequency	881.6 MHz	942.4 MHz	1842.8 MHz	1960.0 MHz
Signal generator frequency	881.66771 MHz	942.46771 MHz	1842.86771 MHz	1960.06771 MHz
Signal generator RF level (CW signal)	-60dBm	-60dBm	-60dBm	-60dBm

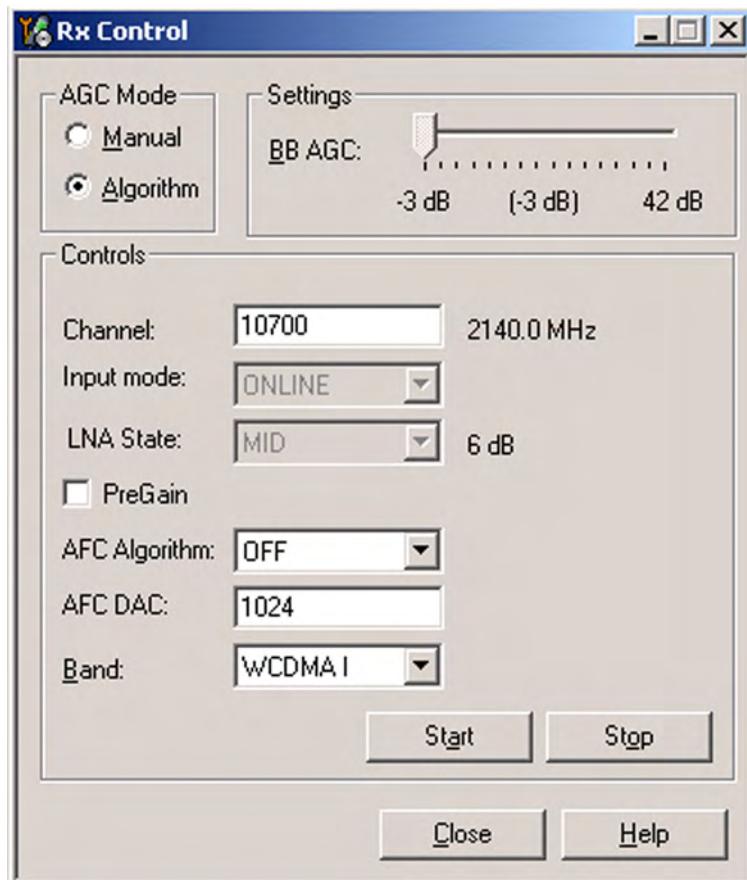

Results

The *RSSI level*/reading should reflect the level of the signal generator (- losses) +/- 5 dB.

When varying the level in the range of -30 to -102 dBm, the reading should follow within +/-5 dB.

WCDMA RX chain activation for manual measurement**Steps**

1. Set the phone to local mode.
2. Activate *RX Control*/tool in Phoenix (**Testing → WCDMA → RX Control**).
3. In the RX Control window, make the following settings:

- Click **Start** to activate the WCDMA RX. If the settings are changed later on (for example, change of channel) you have to click **Stop** and **Start** again.

Note: Channels for testing: WCDMA I 10700, II 9800, IV 1637, V 4408, VIII 3012.

Note: Clicking **Stop** also disables TX control if it was active.

WCDMA RSSI measurement

Prerequisites

WCDMA RX must be activated before RSSI can be measured. For instructions, please refer to chapter *WCDMA RX chain activation for manual measurement*. Connect a signal generator to a proper RF connector on the phone PWB (note: there are two antenna connectors for cellular RF on the phone PWB, one for low bands and one for high bands).

Steps

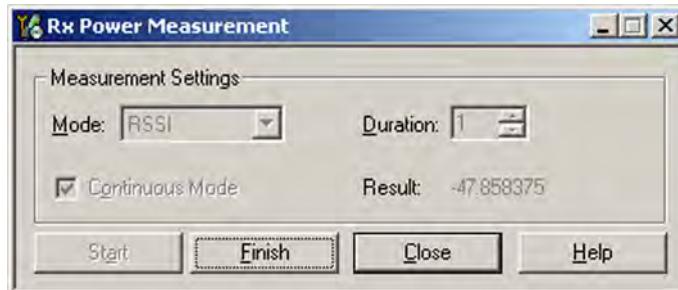

- Use the following frequencies and RF levels in RF generator for different WCDMA bands:

Setting	WCDMA I	WCDMA II	WCDMA IV	WCDMA V	WCDMA VIII
Phoenix: <i>Channel</i>	10700	9800	1637	4408	3012
RX frequency	2140.0 MHz	1960.0 MHz	2132.4 MHz	881.6 MHz	942.4 MHz
Signal generator frequency	2141.0 MHz	1961.0 MHz	2133.4 MHz	882.6 MHz	943.4 MHz

Setting	WCDMA I	WCDMA II	WCDMA IV	WCDMA V	WCDMA VIII
Signal generator RF level (CW signal)	-48 dBm	-48 dBm	-48 dBm	-48 dBm	-48 dBm

2. Activate WCDMA RSSI reading in Phoenix (**Testing → WCDMA → Rx Power Measurement**) .

3. In the Rx Power Measurement window, make the following settings:

4. Click **Start** to perform the measurement.

Results

The *Result* reading should reflect the level of the signal generator (- losses) +/- 5 dB.

When varying the level in the range of -40 to -100 dBm, the reading should follow within +/- 5 dB.

Note: In some versions of the Phoenix service tool, the *WCDMA Rx Power Measurement* tool does not work as it should. In these cases, the result is something really small (for example -8387684.9).

■ Antenna

Antenna overview

RM-626 has four internal antennas:

- GSM/WCDMA low and high band antennas are located under the lower end cap of the phone
- GPS antenna is located under the upper end cap of the phone
- Combined WLAN and Bluetooth antenna is also located under the upper end cap of the phone

The GSM/WCDMA antenna has separate antenna radiators for low and high bands. Connections between the main PWB and the antenna flex assembly are implemented by C-clip contacts (3 pieces) and two coaxial cables (one for low band and the other for high band).

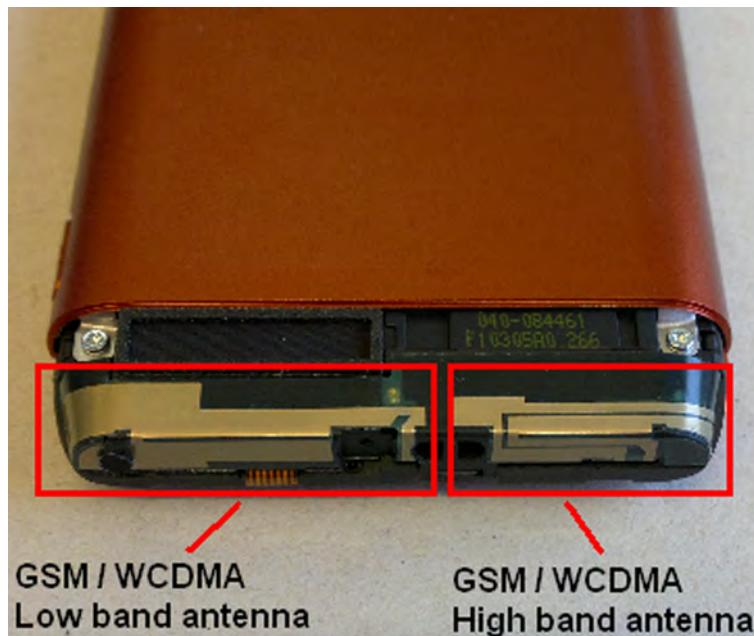

Figure 22 GSM/WCDMA antennas

Bluetooth and WLAN RF interfaces are connected to one common antenna flex. RF feed from the main PWB to the BT/WLAN antenna flex is realized by two C-clips. Similar contact manner is also used for the GPS antenna.

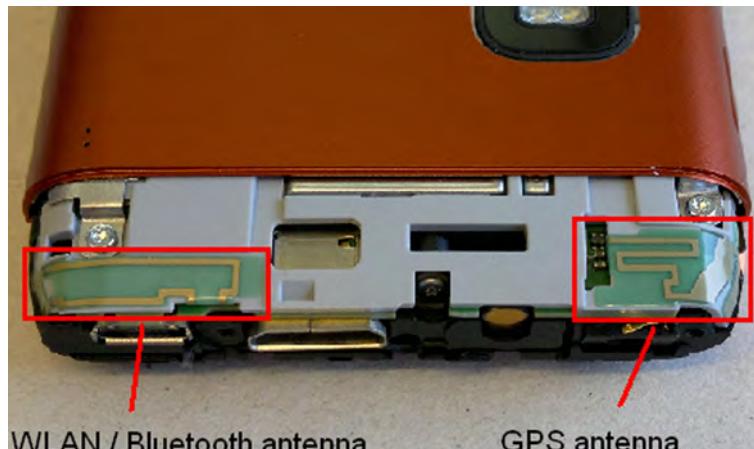

Figure 23 WLAN/Bluetooth and GPS antennas

Antenna troubleshooting

Cellular antenna

GSM/WCDMA antenna performance should be normal if the antenna contact pads take a proper contact to the corresponding C-clips on the small adapter PWB (see the figure below), the antenna flex assembly is visually intact, both coaxial cables are properly connected (both ends) and the cables are undamaged. Check that the C-clips are clearly open and the matching capacitor C7000 (12pF) has been soldered to the PWB.

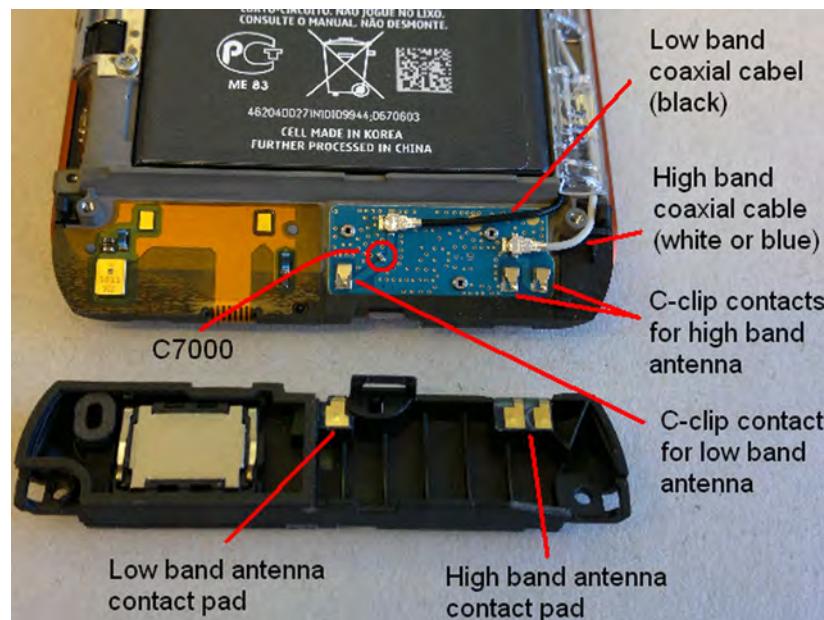

Figure 24 GSM/WCDMA antenna contacts

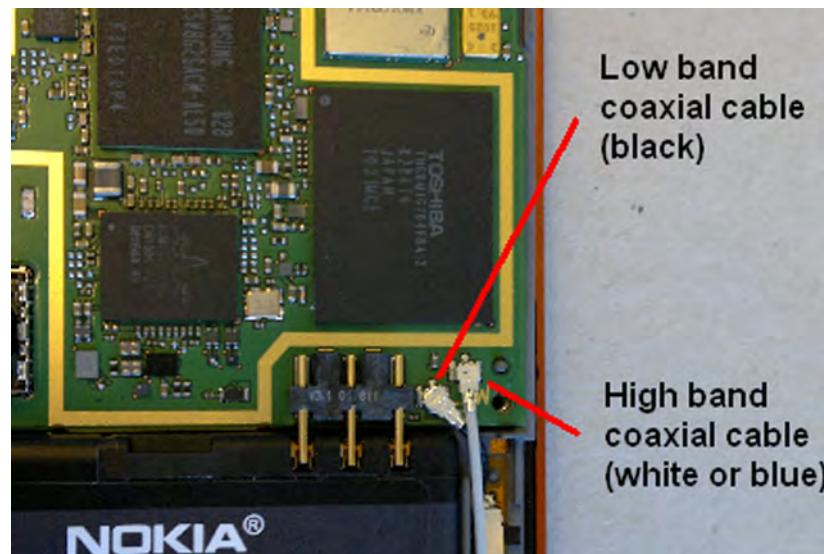

Figure 25 GSM/WCDMA antenna contacts on PWB

WLAN/Bluetooth antenna

WLAN/Bluetooth antenna performance should be normal if the antenna contact pads take a proper contact to the corresponding C-clips on the main PWB (see the following figure) and the WLAN/BT antenna flex assembly is visually intact. Check that the C-clips are clearly open.

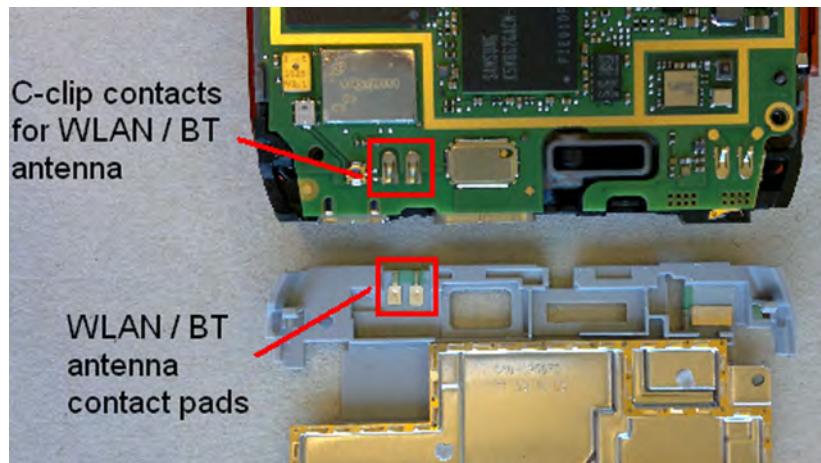

Figure 26 WLAN/Bluetooth antenna contacts

GPS antenna

GPS antenna performance should be normal if the antenna contact pad takes a proper contact to the corresponding C-clips on the main PWB (see the following figure) and the GPS antenna flex assembly is visually intact. Check that the C-clips are clearly open.

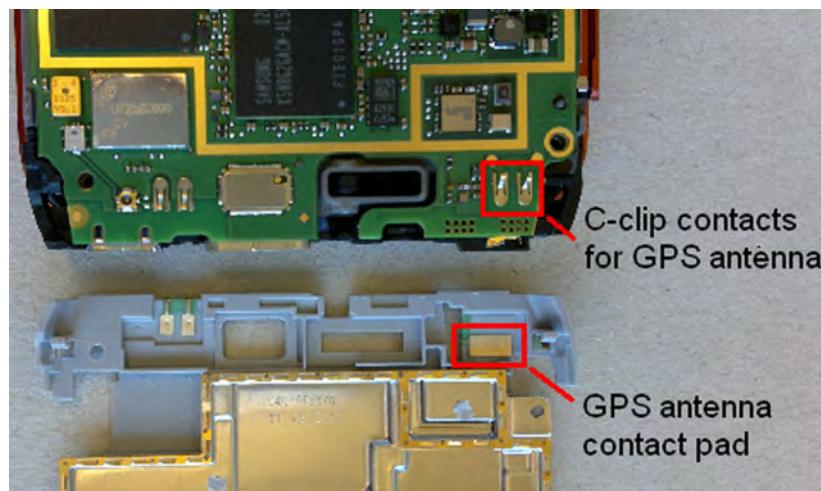

Figure 27 GPS antenna contacts

■ Introduction to camera module troubleshooting

Background, tools and terminology

Faults or complaints in camera operation can be roughly categorised into three subgroups:

- 1 Camera is not functional at all; no image can be taken.
- 2 Images can be taken but there is nothing recognizable in them.
- 3 Images can be taken and they are recognizable but for some reason the quality of images is seriously degraded, or customer complains about image quality.

Image quality is very hard to measure quantitatively, and even comparative measurements are difficult (comparing two images) to do, if the difference is small. Especially if the user is not satisfied with his/her device's image quality, and tells, for example, that the images are not sharp, it is fairly difficult to accurately test the device and get an exact figure which would tell whether the device is functioning properly.

Often subjective evaluation has to be used for finding out if a certain property of the camera is acceptable or not. Some training or experience of a correctly operating reference device may be needed in order to detect what actually is wrong, or is there anything wrong at all.

It is easy for the user to take bad images in bad conditions. Therefore the camera operation has to be checked always in constant conditions (lighting, temperature) or by using a second, known-to-be good device as reference. Experience helps significantly in analysing image quality.

Terms

Digital zoom	Digital zoom is done by first cropping the image by the zoom ratio and then upscaling it to the output resolution. This will decrease the image quality especially with high zoom ratios.
Dynamic range	Camera's ability to capture details in dark and bright areas of the scene simultaneously.
Exposure time	Camera modules use silicon sensor to collect light and for forming an image. The imaging process roughly corresponds to traditional film photography, in which exposure time means the time during which the film is exposed to light coming through optics. Increasing the time will allow for more light hitting the film and thus results in brighter image. The operation principle is exactly the same with silicon sensor, but the shutter functionality is handled electronically.
Flicker	Phenomenon, which is caused by pulsating in scene lighting, typically appearing as wide horizontal stripes in an image.
ND-filter	Neutral density filter is a filter which is used in very bright conditions to reduce the amount of light hitting the sensor. The filter is built into the camera module and applied automatically when needed.
Noise	Variation of response between pixels with same level of input illumination.
Resolution	Usually the amount of pixels in the camera sensor. In some occasions the term resolution is used for describing the sharpness of the images.
Sensitivity	Camera module's sensitivity to light. In equivalent illumination conditions, a less sensitive camera needs a longer exposure time to gather enough light in forming a good image. Analogous to ISO speed in photographic film.

Sharpness	Good quality images are 'sharp' or 'crisp', meaning that image details are well visible in the picture. However, certain issues, such as non-idealities in optics, cause image blurring, making objects in picture to appear 'soft'. Each camera type typically has its own level of performance.
Shutter	The electronic shutter is used when short exposure times are needed and in video.

■ The effect of image taking conditions on image quality

There are some factors, which may cause poor image quality, if not taken into account by the end user when shooting images, and thus may result in complaints. The items listed are normal to camera operation and are not a reason for changing the camera module.

The amount of light available

In dim conditions camera runs out of sensitivity. The exposure time is long (especially in the night mode) and the risk of getting shaken (= blurred) images increases. In addition, image noise level grows. The maximum exposure time in the night mode is $\frac{1}{4}$ seconds. Therefore, images need to be taken with extreme care and by supporting the phone when the amount of light reflected from the target is low. Because of the longer exposure time and larger gain value, noise level increases in low light conditions. Sometimes blurring may even occur in daytime, if the image is taken very carelessly. See the figure below for an example. This is normal; do not change the camera module.

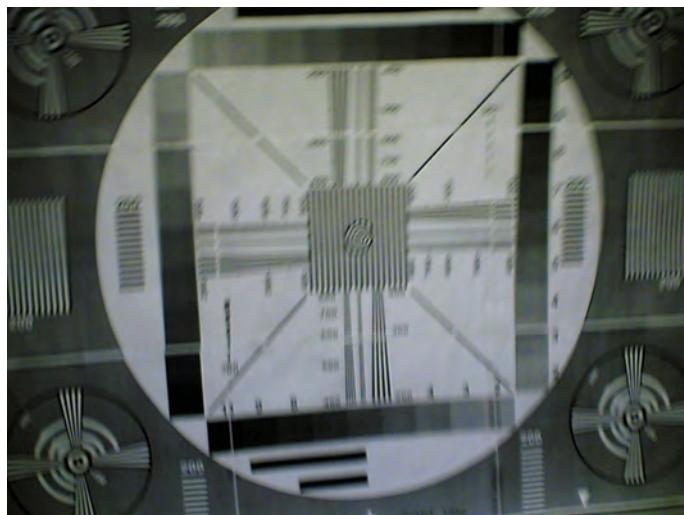

Figure 28 Blurring caused by shaking hands

Movement in bright light

If an image is taken of moving objects or if the device is used in a moving vehicle, object 'skewing' or 'tilting' may occur. This phenomenon is fundamental to most CMOS camera types, and may happen when using the electronic shutter. The movement of camera or object sometimes cause blurring indoors or in dim lighting conditions because of long exposure time. This is normal; do not change the camera module.

Figure 29 Near objects get skewed when taking images from a moving vehicle

Temperature

High temperatures inside the mobile phone cause more noise to appear in images. For example, in +70 degrees (Celsius), the noise level may be very high, and it further grows if the conditions are dim. If the phone processor has been heavily loaded for a long time before taking an image, the phone might have considerably higher temperature inside than in the surrounding environment. This is also normal to camera operation; do not change the camera module.

Figure 30 Noisy image taken in +70 degrees Celsius

Phone display

If the display contrast is set too dark, the image quality degrades: the images may be very dark depending on the setting. If the display contrast is set too bright, image contrast appears bad and "faint". This problem is solved by setting the display contrast correctly. This is normal behaviour; do not change the camera module.

Basic rules of photography (especially shooting against light)

Because of dynamic range limitations, taking images against bright light might cause either saturated image or the actual target appear too dark. In practice, this means that when taking an image indoors and having, for example, a window behind the object, the result is usually poor. This is normal behaviour; do not change the camera module.

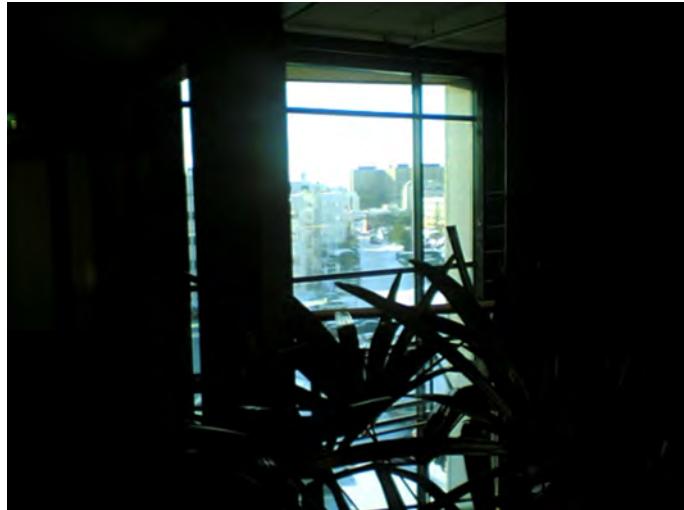

Figure 31 Image taken against light

Flicker

In some occasions a bright fluorescent light may cause flicker in the viewfinder and captured image. This phenomenon may also be a result, if images are taken indoors under the mismatch of 50/60 Hz electricity network frequency. The electricity frequency used is automatically detected by the camera module. In some very few countries, both 50 and 60 Hz networks are present and thus probability for the phenomenon increases. Flickering occurs also under high artificial illumination level. Flickering only occurs when the rolling shutter is used. This is normal behaviour; do not change the camera module.

Figure 32 Flicker in an image; object illuminated by strong fluorescent light

Bright light outside of image view

Especially the sun can cause clearly visible lens glare phenomenon and poor contrast in images. This happens because of undesired reflections inside the camera optics. Generally this kind of reflections are common in all optical systems. This is normal behaviour; do not change the camera module.

Figure 33 A lens reflection effect caused by sunshine

Examples of good quality images

Figure 34 Good image taken indoors

Figure 35 Good image taken outdoors

■ Image quality analysis

Possible faults in image quality

When checking for possible errors in camera functionality, knowing what error is suspected significantly helps the testing by narrowing down the amount of test cases. The following types of image quality problems may be expected to appear:

- Dust (black spots)
- Lack of sharpness
- Bit errors

In addition, there are many other kinds of possibilities for bad image quality, but those are ruled out from the scope of this document since the probability of their appearance is small.

Testing for dust in camera module

Symptoms and diagnosis

For detecting these kinds of problems, take an image of a uniform white surface and analyse it in full resolution. A good quality PC monitor is preferred for analysis. Search carefully, since finding these defects is not always easy. Figure "Effects of dust on optical path" is an example image containing easily detectable dust problems.

When taking a white image, use uniformly lightened white paper or white wall. One possibility is to use uniform light but in this case make sure that the camera image is not flickering when taking the test image. In case flickering happens, try to reduce illumination level. Use JPEG image format for analysing, and set the image quality parameter to 'High Quality'.

Black spots in an image are caused by dirt particles trapped inside the optical system. Clearly visible and sharp edged black dots in an image are typically dust particles on the image sensor. These spots are searched for in the manufacturing phase, but it is possible that the camera body cavity contains a particle, which may move onto the image sensor active surface, for example, when the phone is dropped. Thus it is also possible that the problem will disappear before the phone is brought to service. The camera should be replaced if the problem is present when the service technician analyses the phone.

If a dust particle is lying on the infrared filter surface on either side, they are hard to locate because they are out of focus, and appear in the image as large, grayish and fading-edge 'blobs'. Sometimes they are invisible to the eye, and thus the user probably does not notice them at all. However, it is possible that a larger particle disturbs the user, causing need for service.

Figure 36 Effects of dust on optical path

If large dust particles get trapped on top of the lens surface in the cavity between camera window and lens, they will cause image blurring and poor contrast. The dust gasket between the window and lens should prevent any particles from getting into the cavity after the manufacturing phase.

If dust particles are found on the sensor, this is classified as a manufacturing error of the module and the camera should be replaced. Any particles inside the cavity between the protection window and lens have most probably been trapped there in the assembly phase at a Nokia factory. Unauthorized disassembling of the product can also be the root of the problem. However, in most cases it should be possible to remove the particle(s) by using clean compressed air. Never wipe the lens surface before trying compressed air; the possibility of damaging the lens is substantial. Always check the image sharpness after removing dust.

Testing camera image sharpness

Symptoms and diagnosis

If pictures taken with a device are claimed to be blurry, there are five possible sources for the problem:

- 1 The protection window is fingerprinted, soiled, dirty, visibly scratched or broken.
- 2 The camera module has failed to focus correctly, producing a blurred image.
- 3 User has tried to take pictures in too dark conditions and images are blurred due to handshake or movement. This is not a cause to replace camera module.
- 4 There is dirt between the protection window and the camera lens.
- 5 The protection window is defective. This can be either a manufacturing failure or caused by the user. The window should be changed.

A quantitative analysis of sharpness is very difficult to conduct in any other environment than optics laboratory. Therefore, subjective analysis should be used.

If no visible defects (items 1-4) are found, a couple of test images should be taken. Generally, a well-illuminated typical indoor scene, such as the one in Figure "Good image taken indoors", can be used as a target. The main considerations are:

- The protection window has to be clean.
- The amount of light (300 – 600 lux (bright office lighting)) is sufficient.
- The scene should contain, for example, small objects for checking sharpness. Their distance should be 1 – 2 meters.
- If possible, compare the image to another image of the same scene, taken with a different device. Note that the reference device has to be a similar Nokia phone.

The taken images should be analysed on PC screen at 100% scaling simultaneously with a reference image. Pay attention to the computer display settings; at least 65000 colors (16 bit) have to be used. 256 (8-bit) color setting is not sufficient; true color (24 bit, 16 million colors) or 32 bit (full color) setting is recommended.

If the differences are noticeable at a glance and also if the one under investigation is significantly inferior, the module might have a faulty lens. In this case, the module should be changed. Always re-check the resolution after changing the camera module. If a different module produces a clearly noticeable quality gap, the fault is probably in the camera window. Check the window by looking carefully through it when replacing the module. As references Figure "Good image taken indoors" and Figure "Good image taken outdoors" can be used. Another possibility is to use a service point comparison phone, if available.

Effects of dirty or defective camera lens protection window

The following series of images demonstrates the effects of fingerprints on the camera protection window.

Note: The effects of any dirt in images can vary very much; it may be difficult to judge if the window has been dirty when some image has been taken or if something else has been wrong. That is why the cleanliness of the protection window should always be checked and the window should be wiped clean with a suitable cloth.

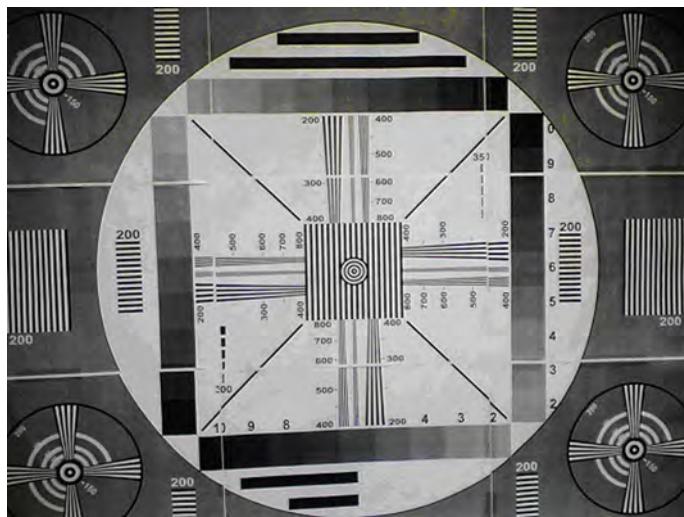

Figure 37 Image taken with clear protection window

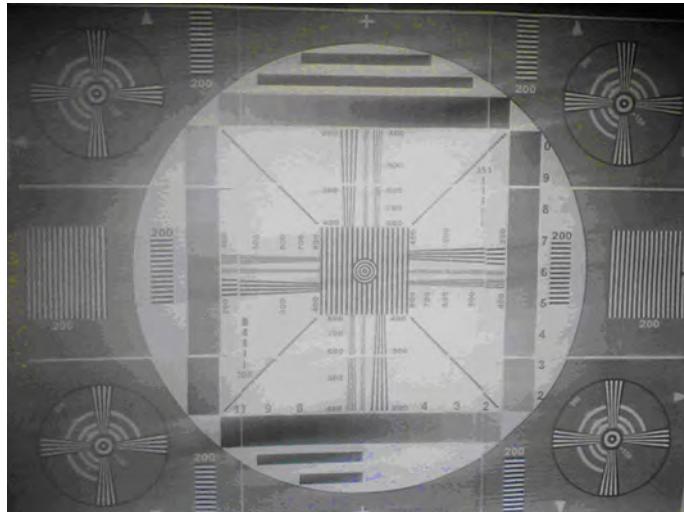

Figure 38 Image taken with greasy protection window

Bright point light sources might cause images that have flares around the light source if the protection window is dirty. A smeared fingerprint may be hard to see on the protective window but it will affect the image quality. These flares can be avoided by cleaning the window with a suitable cloth.

Figure 39 Image of point light sources taken with a clean protective window

Figure 40 Image of point light sources taken with a dirty (finger print) protective window

Faulty pixels in images

Faulty pixels are pixels that do not respond to light in the same way as the pixels around them. There are three main types of faulty pixels, dead, stuck and hot pixels.

Dead pixels are always black or significantly darker than their surrounding. Dead pixels appear as black spots in all lightning conditions. Camera modules producing images with dead pixels that are clearly noticeable should be replaced.

If the pixel remains always saturated to its maximum value it is stuck. Stuck pixels may appear as red, green, blue or white spots in all lightning conditions. Camera modules producing images with one or more stuck pixels should be replaced.

Hot pixels are pixels that easily saturate in dim light conditions. It is normal to get a lot of noise and hot pixels in night conditions or otherwise dark conditions. The hot pixels should disappear when the ambient light is increased, but may still appear in darker areas of an otherwise well illuminated scene. This is normal behavior, do not change the camera.

When examining an image for defect pixels, test images should be viewed as 100% enlargements on a PC monitor.

Figure 41 Enlargement of a hot pixel

Flash photography problems

Use of flash device may affect the image in many ways.

- White balance errors. The image may get a wrong tone due to mixing of flash colour temperature and ambient lightning. This is unwanted but normal feature.
- Dust reflections. Dust or water drops in front of the flash unit may reflect strongly to the camera sensor. See the following figure.

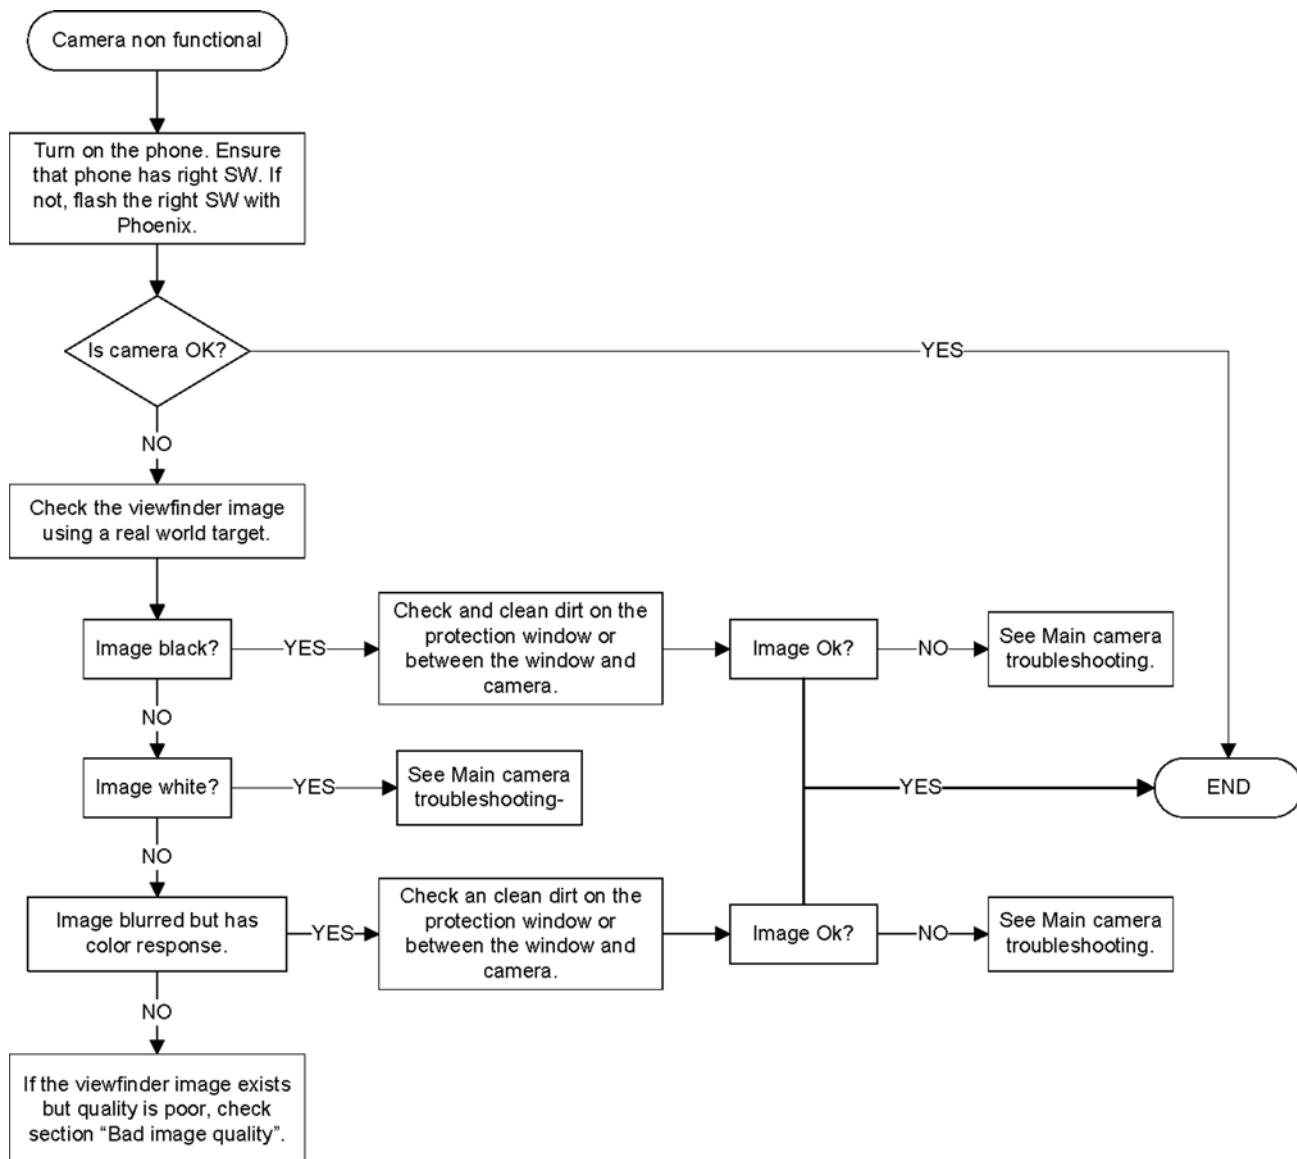

Figure 42 Light from the flash has reflected on particles in front of the camera

■ Introduction

Phone description

RAPUYAMA is the main digital baseband ASIC in the phone. It contains functionality for both WCDMA and GSM EDGE. The hardware accelerator is used for imaging and video.

GAZOO/PEARL (N2200) is the main audio and energy management controller for the phone.

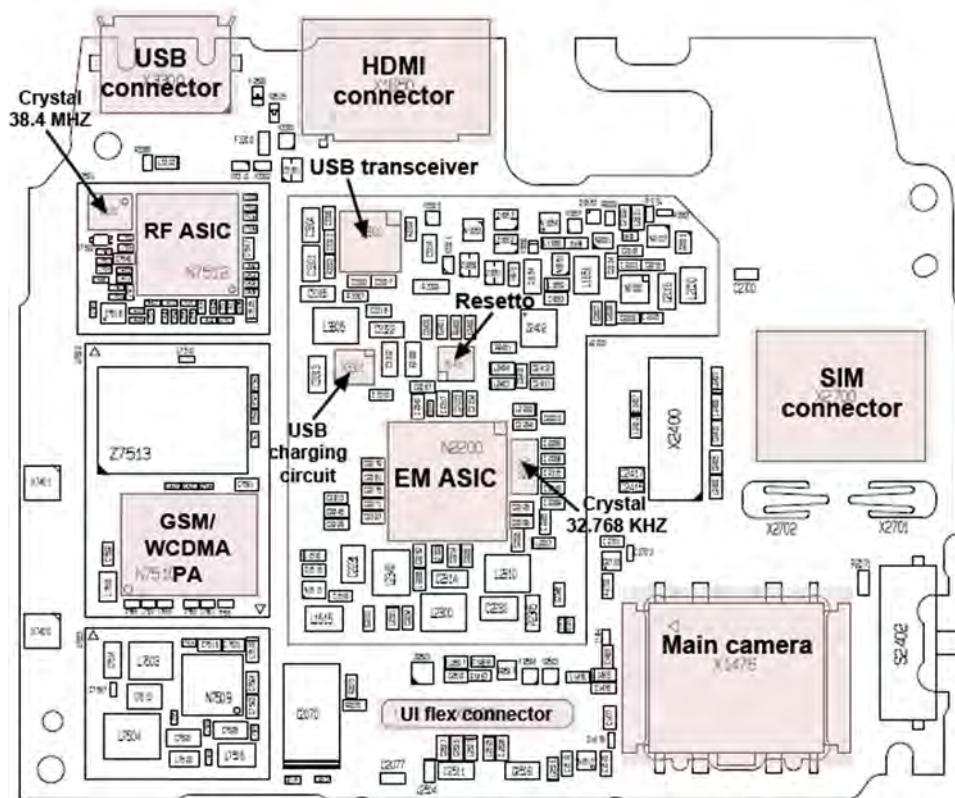

Key components

Board and module connections

■ Energy management

Battery and charging

BL-4D battery

The phone is powered by a 3-pole BL-4D battery 1200 mAh battery. The three poles are named VBAT, BSI and GND where the BSI line is used to recognize the battery capacity. This is done by means of an internal battery pull down resistor.

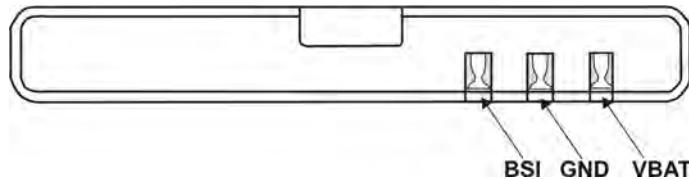

Figure 43 Battery pin order

The battery temperature is estimated by measuring separate temperature NTC resistor via the BTEMP line of EM ASIC N2200. This is located on the main PWB, near the battery connector.

Battery connector

The battery connector is a blade connector. It has three blades;

- BSI (Battery size indicator)
- GND (Ground)
- VBAT (Battery voltage)

Figure 44 Blade battery connector

Charging

This phone is charged through the micro USB connector. Charging is controlled by energy management, and external components are needed to protect the baseband module against EMC, reverse polarity and transient frequency deviation.

Normal and extreme voltages

Energy management is mainly carried out in the EM ASIC (N2200) that contains a number of regulators. In addition, there are also some external regulators.

In the table below normal and extreme voltages are shown when a BL-4D battery is used.

Table 10 Nominal voltages

Voltage	Voltage [V]	Condition
General Conditions		
Nominal voltage	3.700	

Voltage	Voltage [V]	Condition
Higher extreme voltage (fast charging)	4.230	
HW Shutdown Voltages		
Vmstr+	2.1 ± 0.1	Off to on
Vmstr-	1.9 ± 0.1	On to off
SW Shutdown Voltages		
Sw shutdown	3.15	In call
Sw shutdown	3.25	In idle
Min Operating Voltage		
Vcoff+	2.9 ± 0.1	Off to on
Vcoff-	2.6 ± 0.1	On to off

Power key and system power up

When the battery is placed in the phone, the power key circuits are energized. When the power key is pressed, the system boots up (if an adequate battery voltage is present).

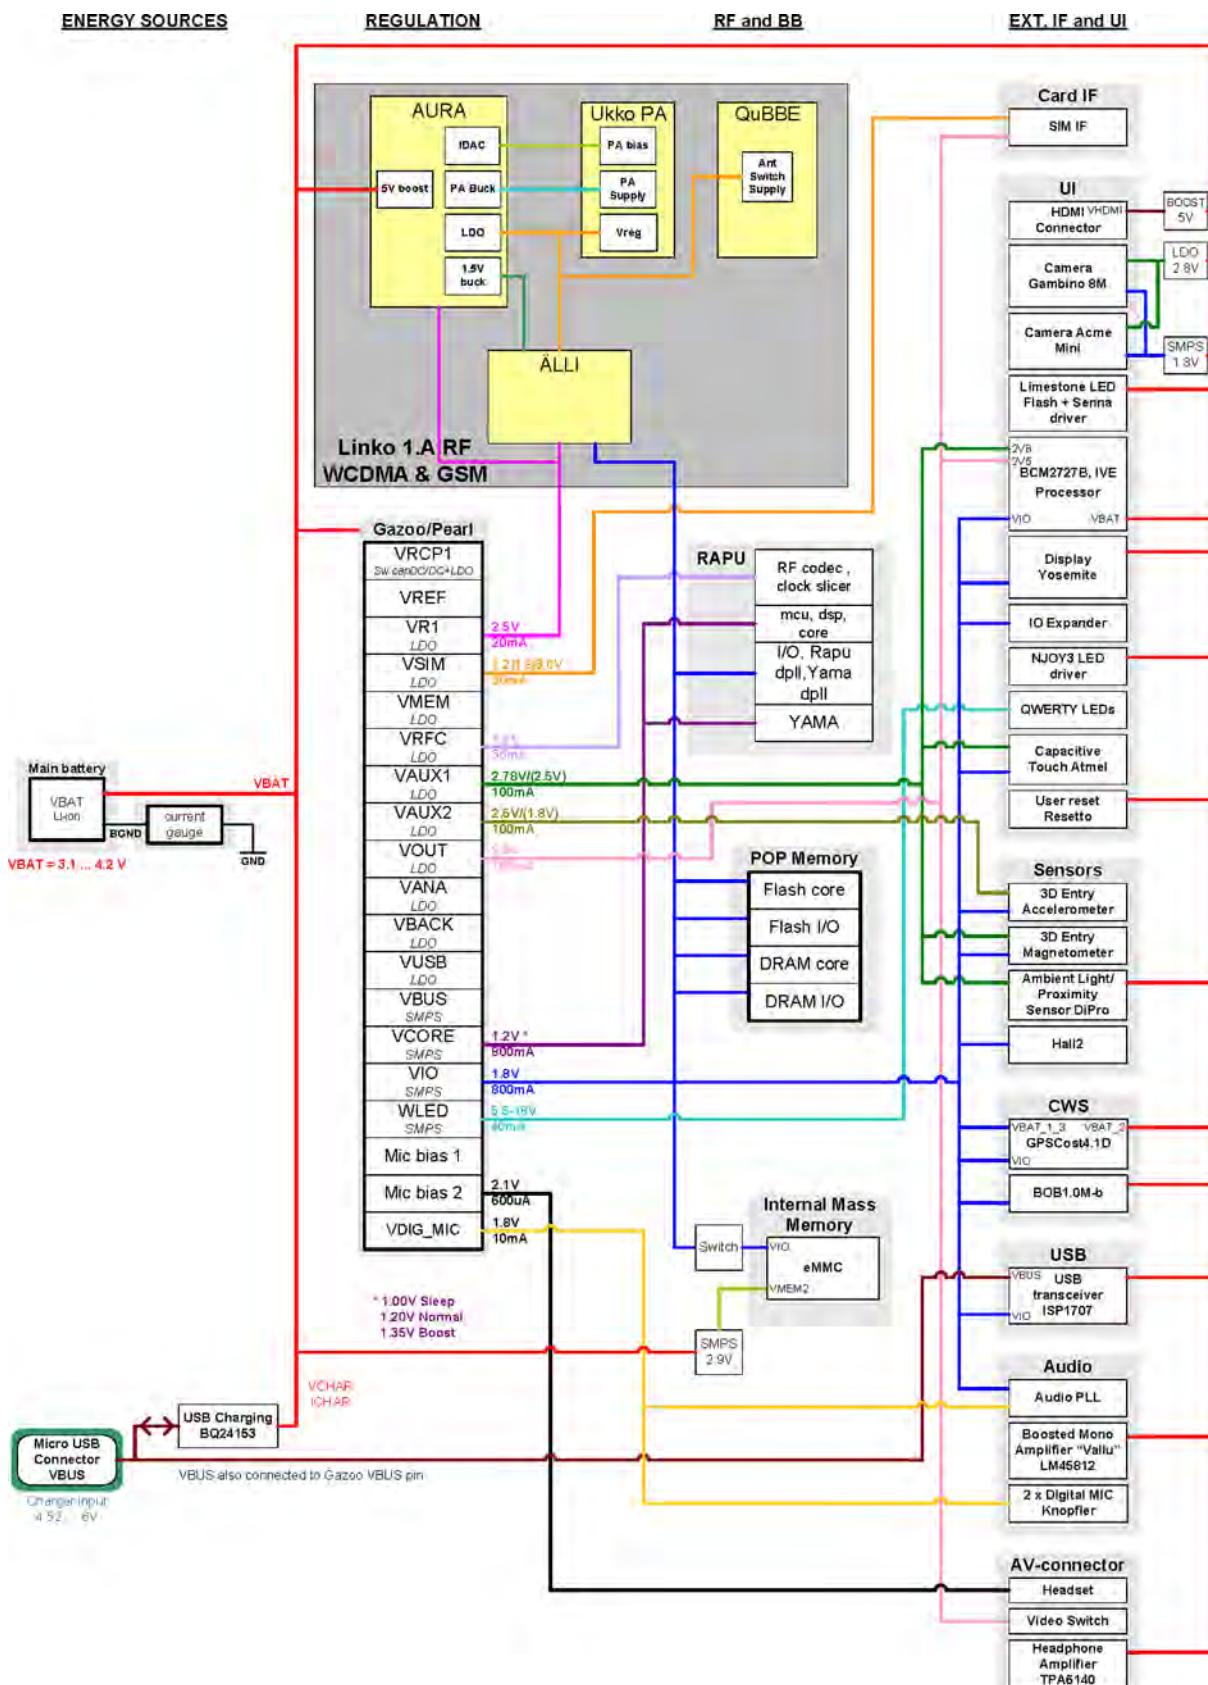

Power down can be initiated by pressing the power key again and the system is powered down with the aid of SW. The power key is connected to EM ASIC (N2200) via the PWRONX signal.

The PWRONX line cannot be detected when SW hangs. For that reason, the user has to remove the battery. Because the semi-fixed battery is difficult to remove, a fixed delay circuit Resetto IC (N2400) is used. The PWRONX is also connected to Resetto. When the user presses the power key beyond 7.5 secs, it generates a reset which is connected to EM ASIC's UserResetX line. The UserResetX is entirely HW controlled, so even when SW hangs, the phone can be powered down by pressing the power key beyond 7.5 sec.

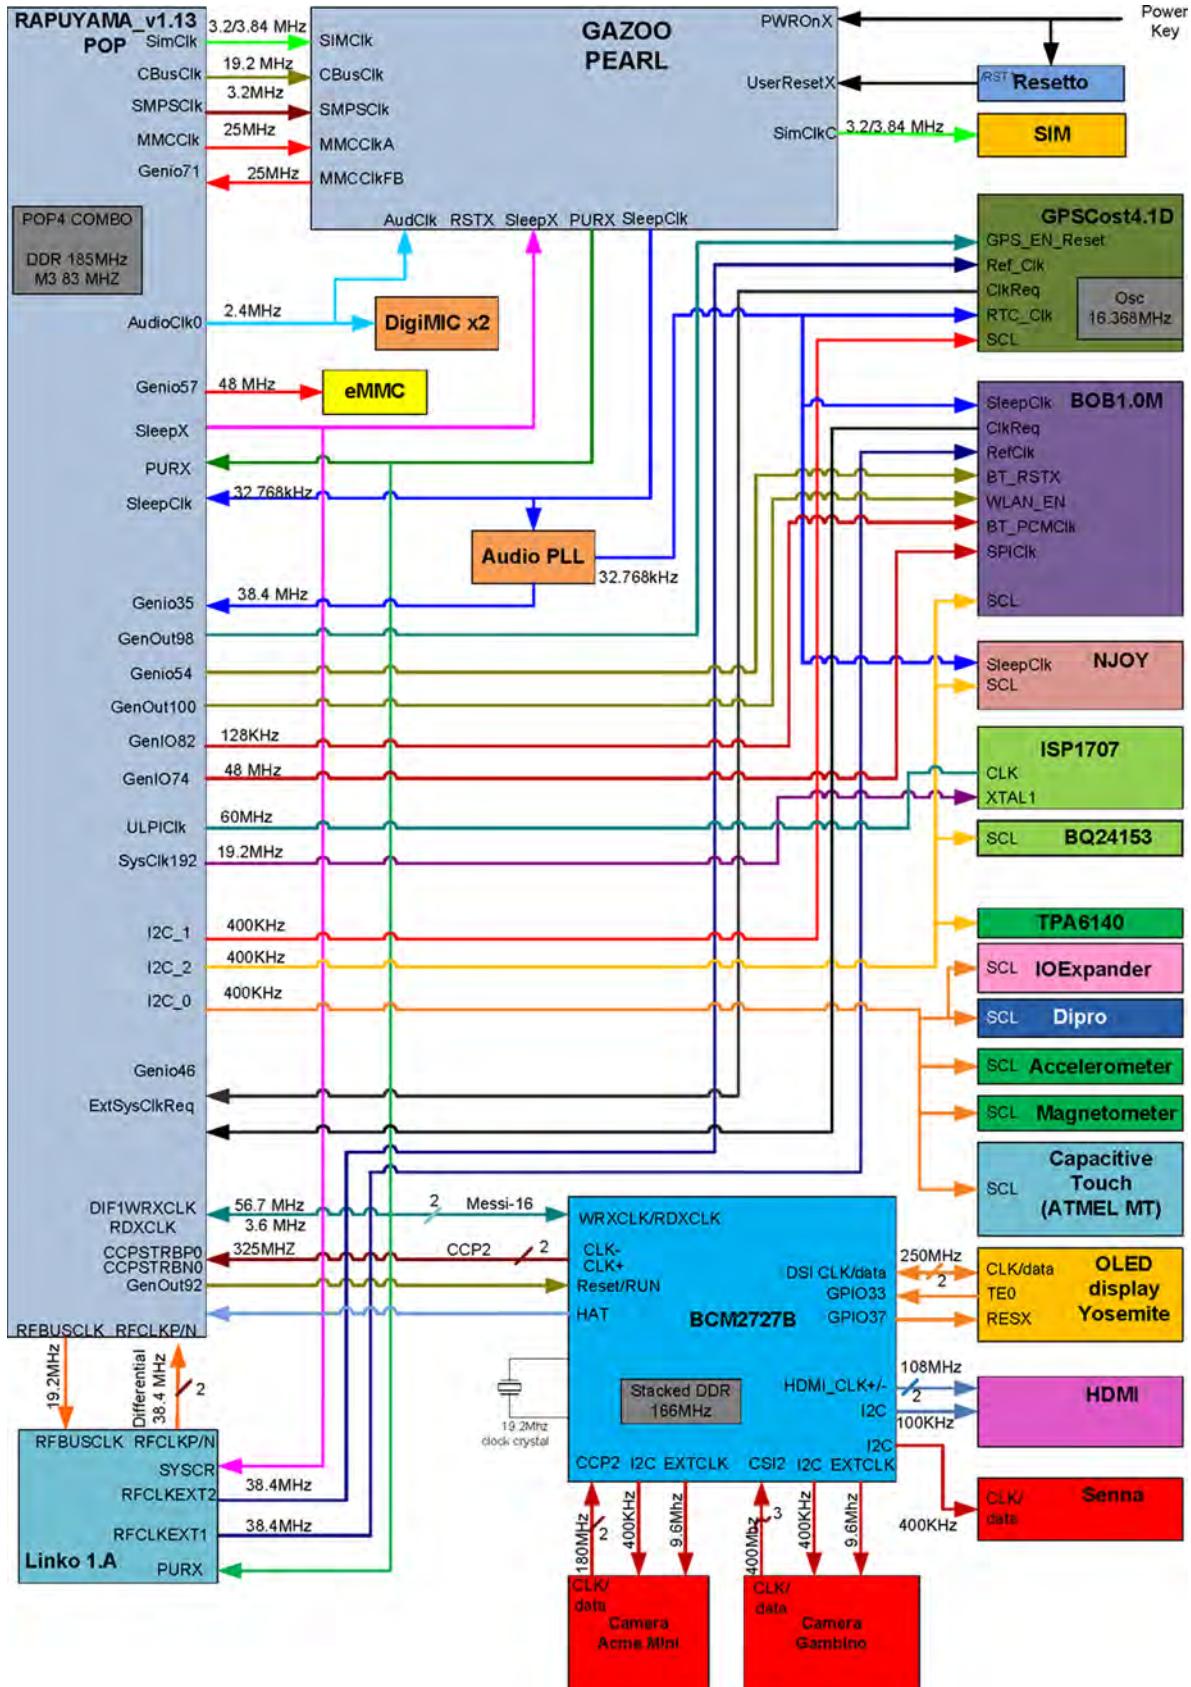

Modes of operation

Mode	Description
NO_SUPPLY	(Dead) mode means that the main battery is not present or its voltage is too low (below N2200 master reset threshold) and that the back-up battery voltage is too low.
PWR_OFF	In this mode (warm), the main battery is present and its voltage is over N2200 master reset threshold. All regulators are disabled, PURX is on low state, the RTC is on and the oscillator is on. PWR_OFF (cold) mode is almost the same as PWR_OFF (warm), but the RTC and the oscillator are off.
RESET	RESET mode is a synonym for start-up sequence. RESET mode uses 32 kHz clock to count the RESET mode delay (typically 16ms).
SLEEP	SLEEP mode is entered only from PWR_ON mode with the aid of SW when the system's activity is low.
FLASHING	FLASHING mode is for SW downloading.

Power distribution

Clocking scheme

SIM interface

The phone has a SIM (Subscriber Identification Module) interface including a SIM connector.

The SIM interface consists of an internal interface between RAPU and EM ASIC (N2200), and an external interface between EM ASIC and SIM contacts.

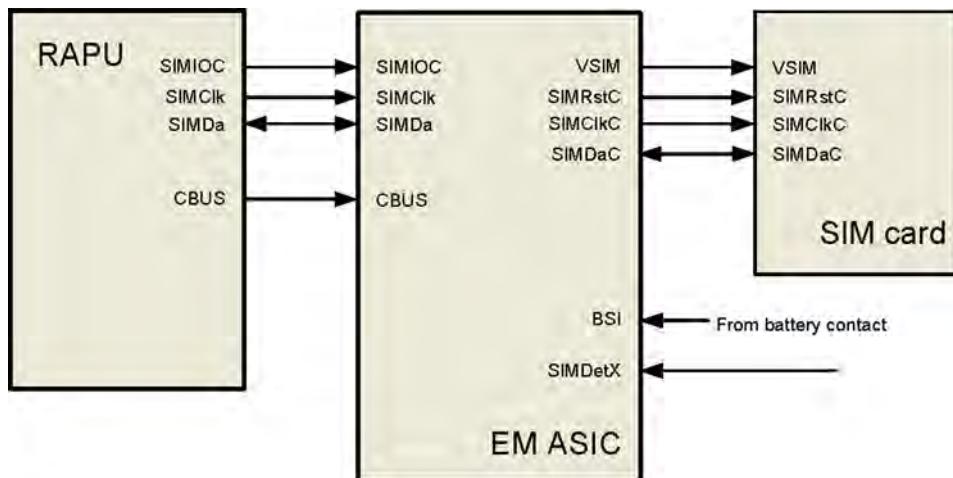

Figure 45 SIM interface

As the phone does not have a traditional battery cover due to semi-fixed battery concept, the SIM card can be removed and inserted without removing the battery.

For safe SIM card functionality, SIM card removal detection is used with detection springs touching the SIM card tray.

Only pre-warning signal is used which is connected to SimDetX input of Gazoo/Pearl via inverter circuit. The following figure shows the principle of SIM circuitry with the removable SIM tray.

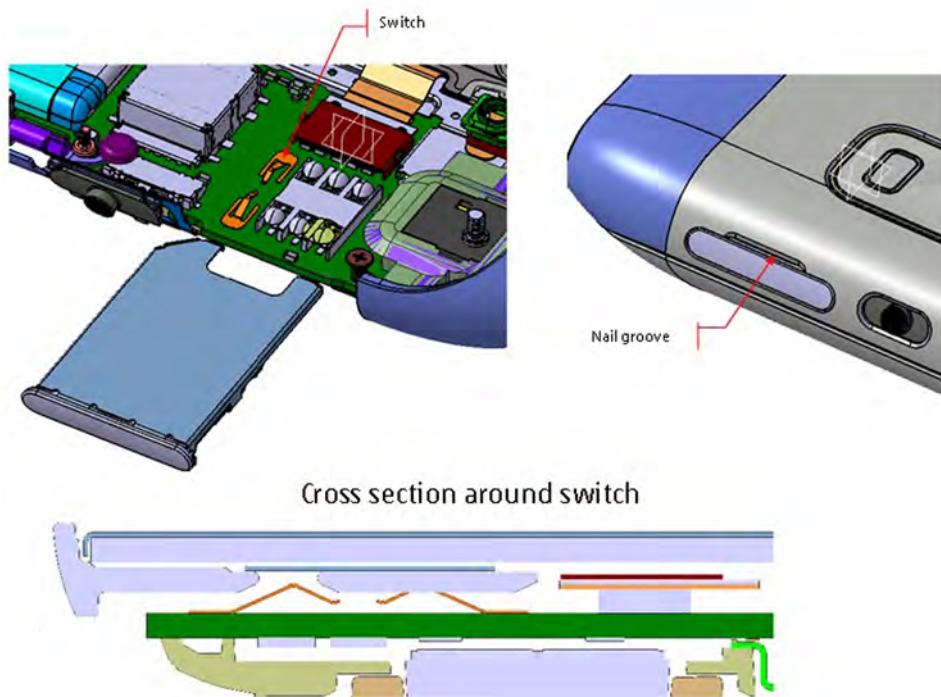

Figure 46 SIM circuitry with removable tray

The SIM interface supports both 1.8V and 3.0V SIM cards. The SIM interface voltage is first 1.8 V when the SIM card is inserted, and if the card does not respond to the ATR (Answer to Request), 3V interface voltage is used.

■ Device memory

The memory components of the device are internal COMBO POP4 2Gb DDR + 8Gb M3 (NAND) and 16GB eMMC memory which is non-removable and internal to the phone.

The device uses 16GB eMMC (D3200) external memory. The eMMC interface is a 6-wire serial/parallel data bus which includes a clock (CLK), 4 data signals (DAT), and command (CMD) wires. The eMMC interface is completely formed of the GENIOs of RAPU. The eMMC consists of an internal NAND controller and an MMC controller for I/O interface. It is a dual supply device which requires VCC of 2.9V for the NAND core and VCCQ of 1.8V for the MMC I/O interface.

■ BOB1.0M-b module

The BOB1.0M-b module provides full 802.11b,g & n WLAN, BT 2.1 + EDR, and FM RDS connectivity.

BOB is the name given to a generic technology release that combines WLAN, Bluetooth, and FM Rx radio on a single monolithic IC. The phone uses BOB1.0M-b module that consists of a single chip transceiver WL1271, plus a separate RF front end (FE) device. The BOB1.0M-b release operates in the 2.4GHz (ISM) and the 76-108MHz FM bands.

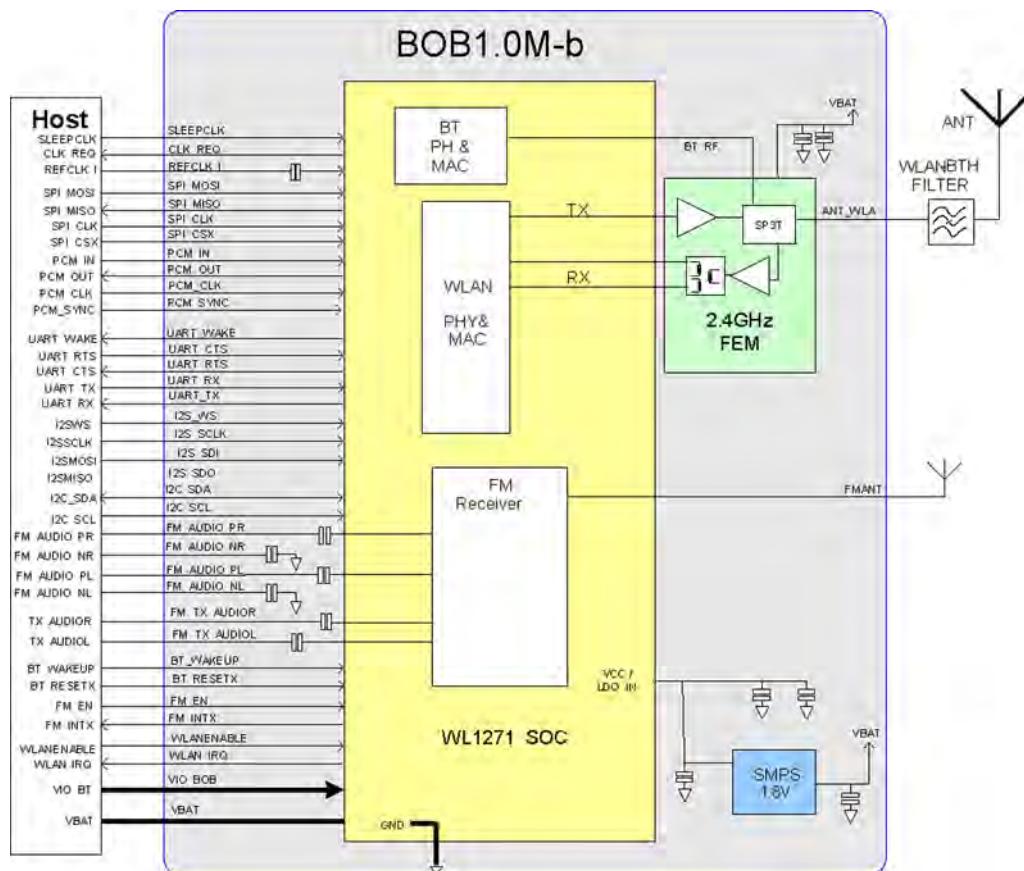

Figure 47 BOB1.0M-b module block diagram and application circuit

From a troubleshooting point of view, WLAN is tested separately, but BTH and FMRX are checked in parallel.

REFOUT_EXT1 single ended 38.4 MHz analog clock from Linko RF is provided to BOB1.0M-b. The clock request for the reference clock in the BOB1.0M-b module is shared between WLAN and BTHFM blocks. When either system requires a clock, this signal will be active. The CLK_REQ is connected to ExtSysClkReq pin of RAPU. The SLEEPCLK input of 32.768 KHz clock from EM ASIC is used for power management and for FM in low power mode.

The internal SMPS supplies the whole BOB1.0M-b solution from the phone battery supply, VBAT, apart from VIO which is needed for interface signal reference levels.

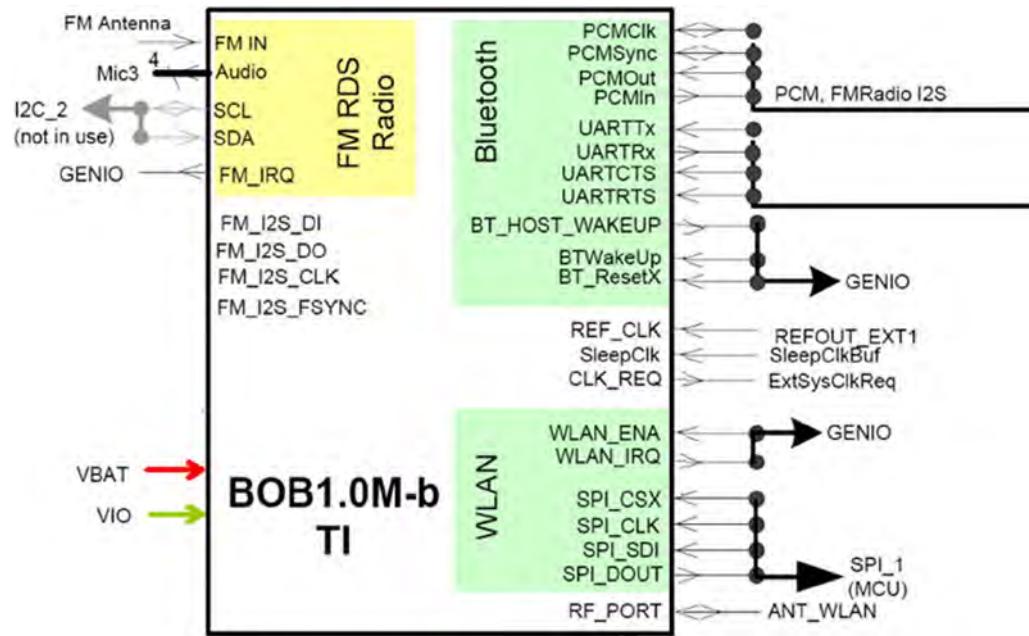

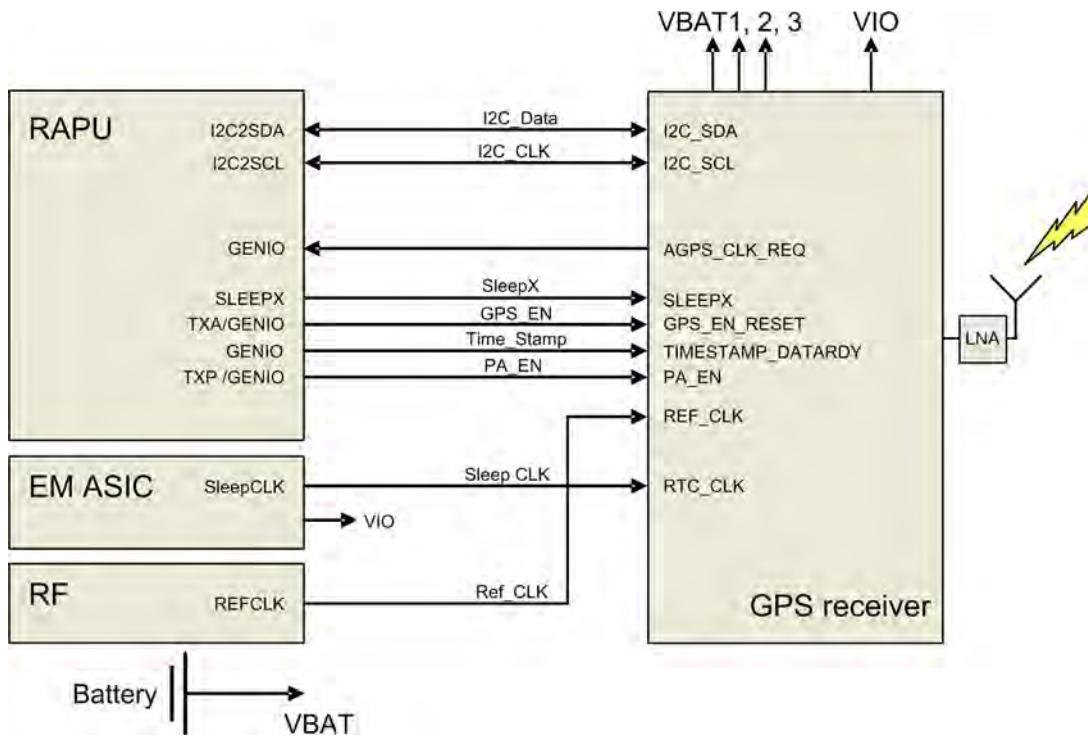

Figure 48 BOB1.0M-b interface

■ GPS interface

The phone includes an inbuilt single chip GPS receiver GPSCost4.1D, comprising both RF and BB blocks integrated in a single digital die. GPSCost4.1D is connected to RAPU ASIC via I2C_1 and some GENIOs. GPSCost4.1D operates in Multi-master mode and the REF clock is requested via AGPS_CLK_REQ signal connected to RAPU genio46. REFOUT_EXT2 single ended 38.4 MHz analog clock from Linko RF is provided to GPSCost4.1D.

**Figure 49 GPS interface**

■ USB

USB interface and charging

The phone has an interface for USB (Universal Serial Bus). USB is a differential serial bus that provides a wired connectivity between a PC and peripheral devices, as in this case a mobile phone.

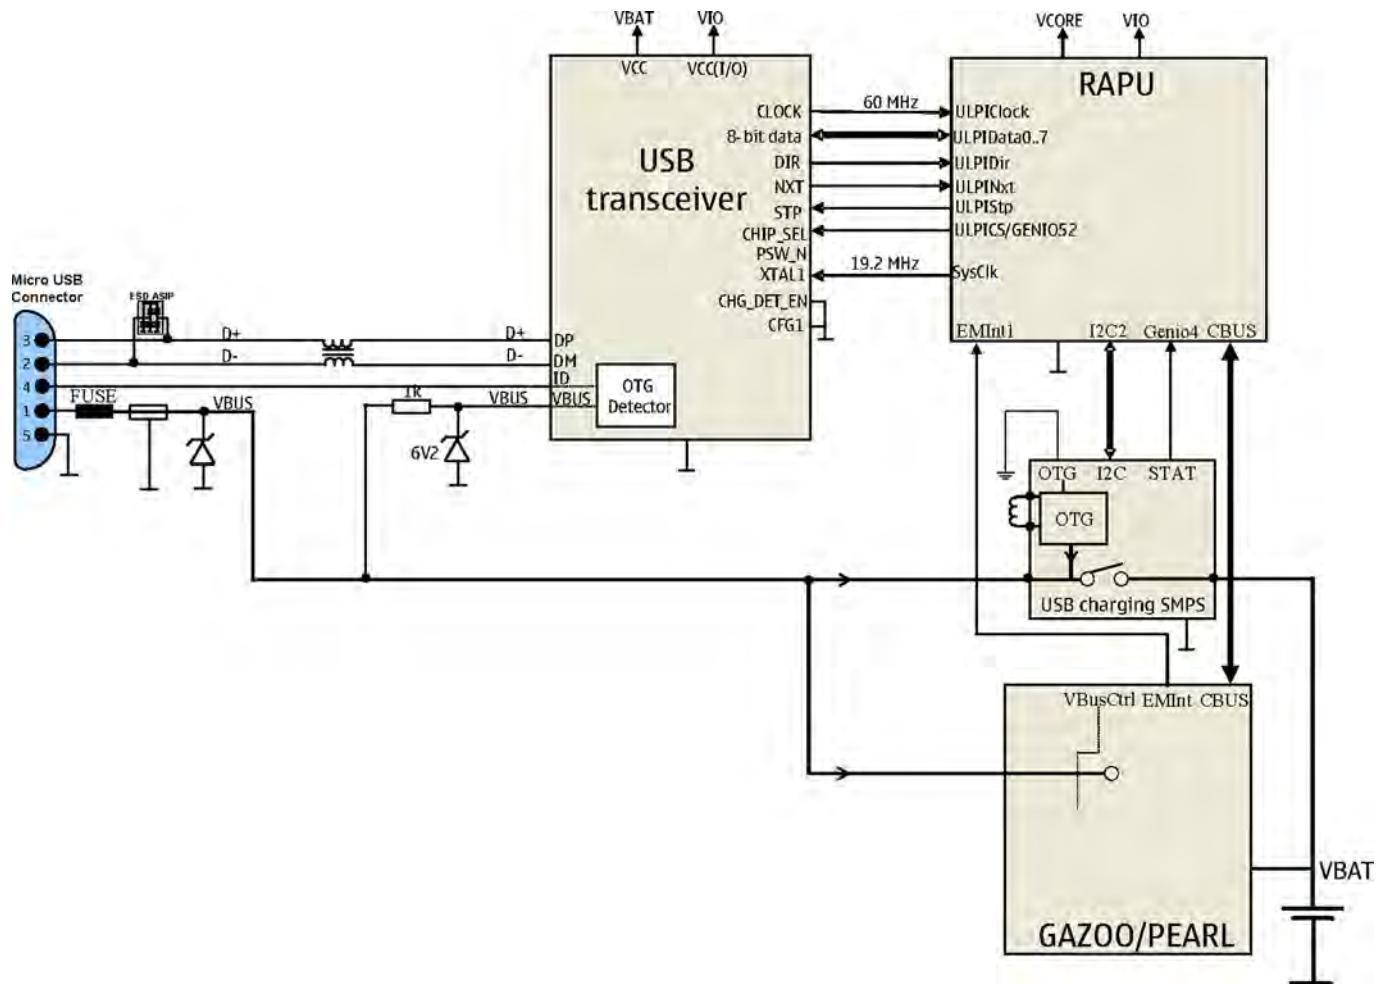

Figure 50 USB interface

The phone supports USB 2.0 with High-Speed (480 Mbps).

Hot swap is supported, which means that USB devices may be plugged in and out at any time.

MicroUSB connector

This phone is provided with a specific connector for microUSB.

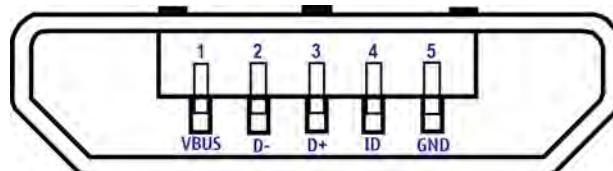

Figure 51 MicroUSB connector

User interface

Touch module

This phone uses Atmel capacitive touch solution.

The Atmel touch module is interfaced to I2C0 bus of RAPU via level shifter (N2500). RAPU's GenI0123 is used for Touch INT.

The Atmel touch module uses VAUX1 for its analogue supply and VIO for its digital supply. Communication with RAPU is via Symbian I2C bus.

Whenever the user touches the touch screen, the controller raises an interrupt to RAPU which initiates I2C transactions to identify the locations the user touches on the display.

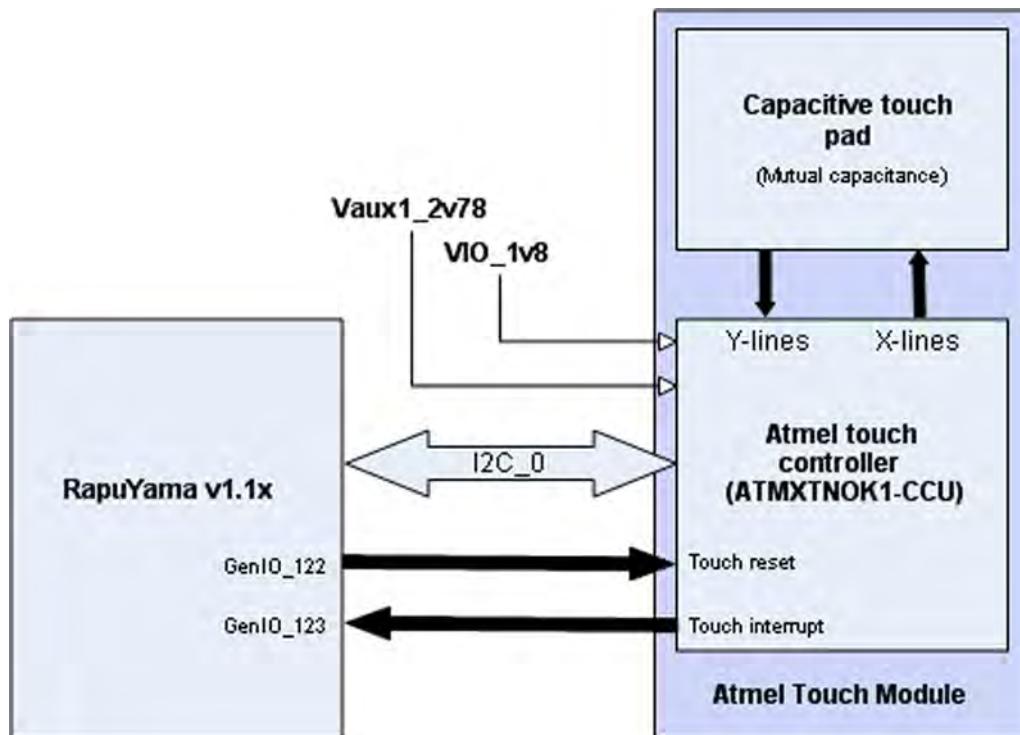

Figure 52 Touch system block diagram

Proximity sensor and ambient light sensor

This phone uses a combined proximity and ambient light sensor called DiPro.

The proximity part of the device uses an external IR LED supplied by VBAT. The current this LED consumes is controlled by DiPro and set using software. The interrupt output of DiPro changes state when the infra red light from the LED is reflected back by a suitable reflective surface.

Note that when proximity is in use, during a voice call, the proximity sensor detects face and turns off the display and touch to prevent false key pressing.

The ambient light sensor detects the level of ambient light and adjusts the display and key brightness accordingly whenever the display is active. Covering this sensor results in dimmed display and key lights.

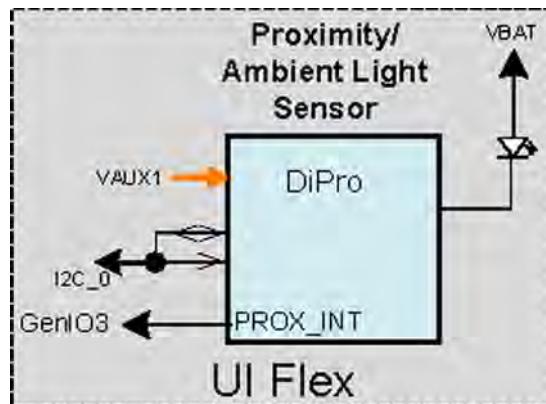

Figure 53 Proximity sensor and ALS

Imaging and video

Multimedia application processor

Multimedia application processor, BCM2727B, is used as a HW accelerator for imaging and video graphics. The key features of BCM2727B are:

- 8MPix primary camera
- Secondary camera
- Dual LED flash
- nHD OLED DSI display
- 720p HDMI or NTSC/PAL analog TV-out

MeSSI-16 and CCP2-Tx are the key interfaces between RapuYama and BCM2727B. BCM2727B has in-build 256Mb stacked SDRAM.

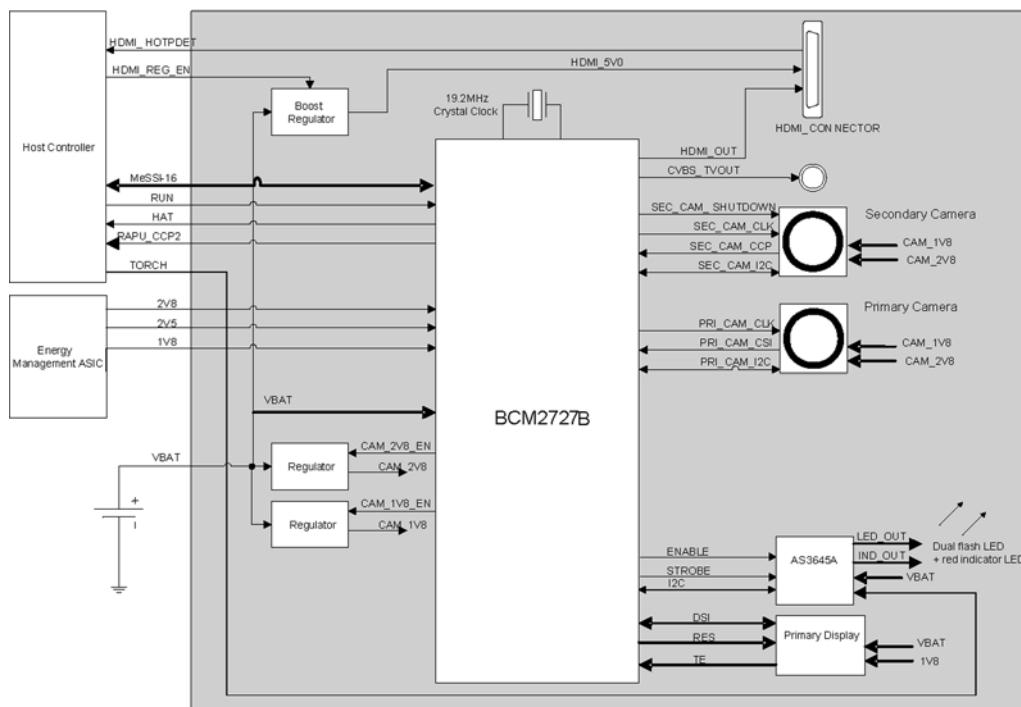

Figure 54 BCM2727B block diagram

Display module

This phone uses a 4" OLED type nHD Yosemite display with 16 million colors. The display module supports the display format of 640 rows x 360 columns . The dimension of the display module is 53.76 mm x 97.16 mm x 2.21 mm. The module interfaces to the phone via FPC with a 20 pins board to board connector.

The primary display is controlled by BCM2727B over DSI interface. The DSI Interface is used for data transfer and control. Other display signals, RESET and TE, are interfaced to BCM2727B.

TV-out interface

The phone has HDTV and SDTV capability. The phone can be connected to HDTV through Type A to Type C HDMI cable, and to analog TV through a TV-out cable.

BCM2727B supports both 720p 30fps HDMI and Analog PAL/NTSC TV-out.

For the HDMI interface, both audio and video data is passed from the host to BCM2727B over MeSSI-16 interface and BCM2727B sends the data to the HDMI connector.

For the Analog TV-out, video data is passed from the host to the BCM2727B over MeSSI-16 interface and BCM2727B sends it to the AV connector. Audio is routed separately by the host to the AV connector.

Cameras

This phone has two cameras, an 8 MPix resolution main camera and a VGA resolution secondary camera. A dual LED flash is used for the main camera.

Primary camera (Gambino)

The primary camera is an 8 Megapixel EDOF (Enhanced Depth of Field) camera module. The module size is 8.5 mm x 8.5 mm x 6.1 mm and it fits into the 14-pin camera socket on the phone. The camera module is SMIA profile 2 compliant and is configured by the BCM2727B using I2C control bus. Image data is transferred to the BCM2727B for further processing over CSI-2 (PRI_CAM_CSI).

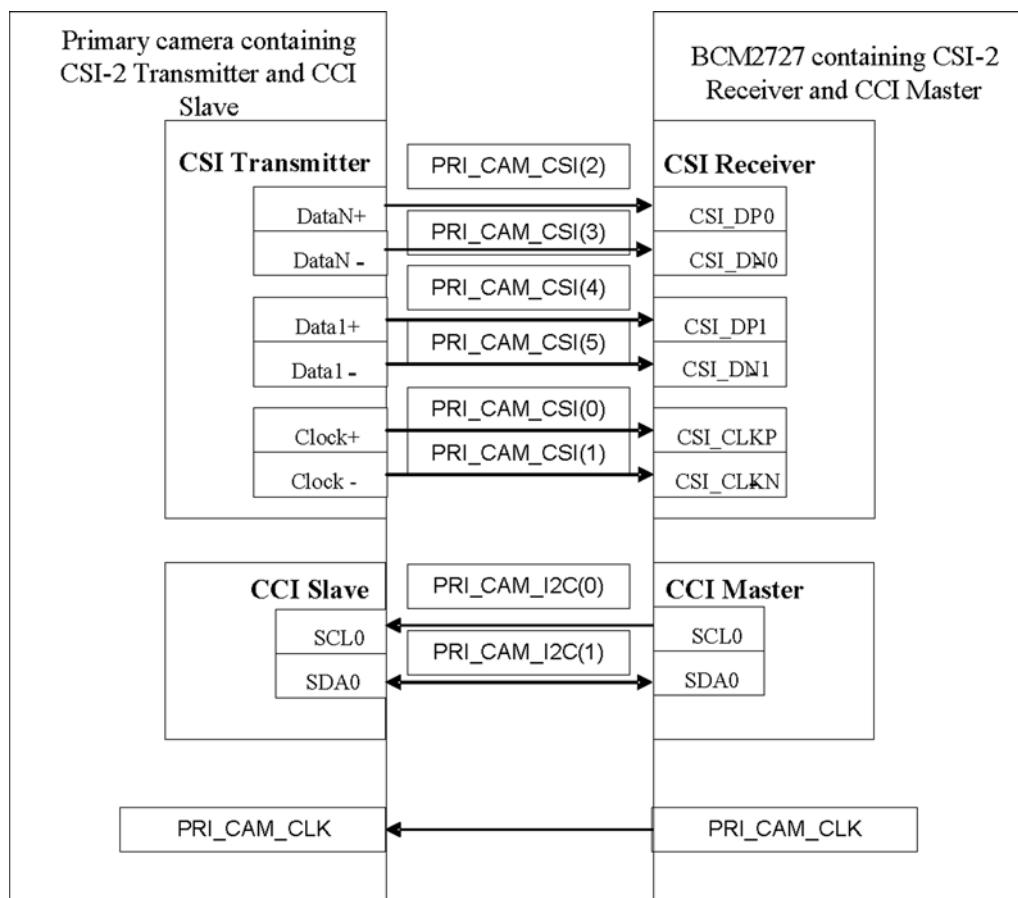

Figure 55 Primary camera interface

Secondary camera (VGA Acme mini)

The secondary camera is a VGA fixed focus camera module. It is SMIA compliant and is configured by the BCM2727B using I2C control bus. Image data is transferred to the BCM2727B for further processing over a CCP based bus (SEC_CAM_CCP).

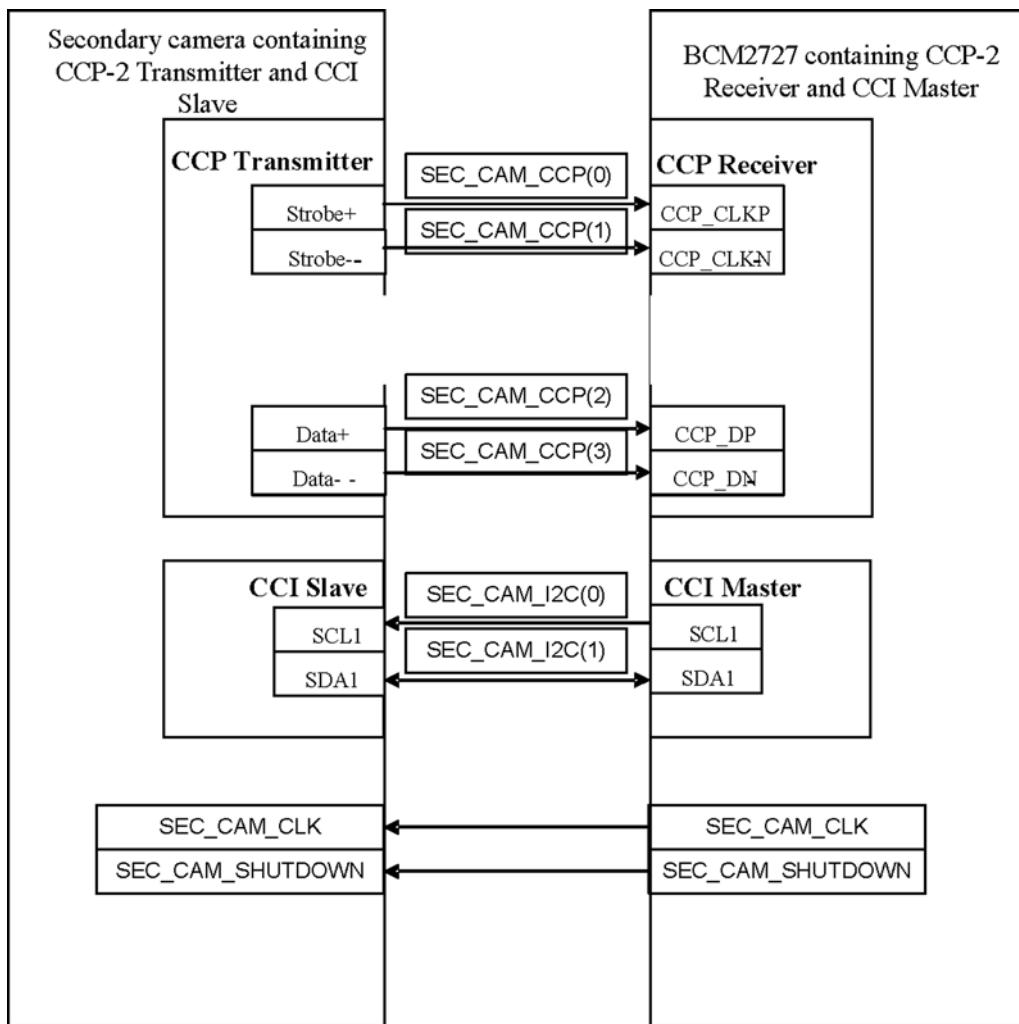

Figure 56 Secondary camera interface

Flash (dual LED)

The dual LED flash consists of two high power white LEDs for use as a camera flash, torch mode and video light. The torch and video light have significantly reduced power compared to the image capture flash. A red indicator light is also present for privacy reasons to indicate when an image is being captured or a video recorded.

Illumination

Key illumination

Only MENU or HOME key illumination is supported and is handled by RGB 3 channel LED driver NJOY-3. 2 white LEDs, V2420 and V2422, are used for MENU key illumination. These LEDs are connected in parallel to R output of NJOY-3 LED driver.

Charging illumination

2 white LEDs are used for charging indication.

One white LED (V2505) is connected to EM ASIC "ChInd" pin and blinks only during dead battery USB charging in intervals of 1.5s. This LED is OFF when the charging is taking place under SW control.

The second white LED (V2506) is connected to B output of NJOY-3 LED driver and glows for indicating USB charging controlled by SW. This LED is OFF during dead battery charging.

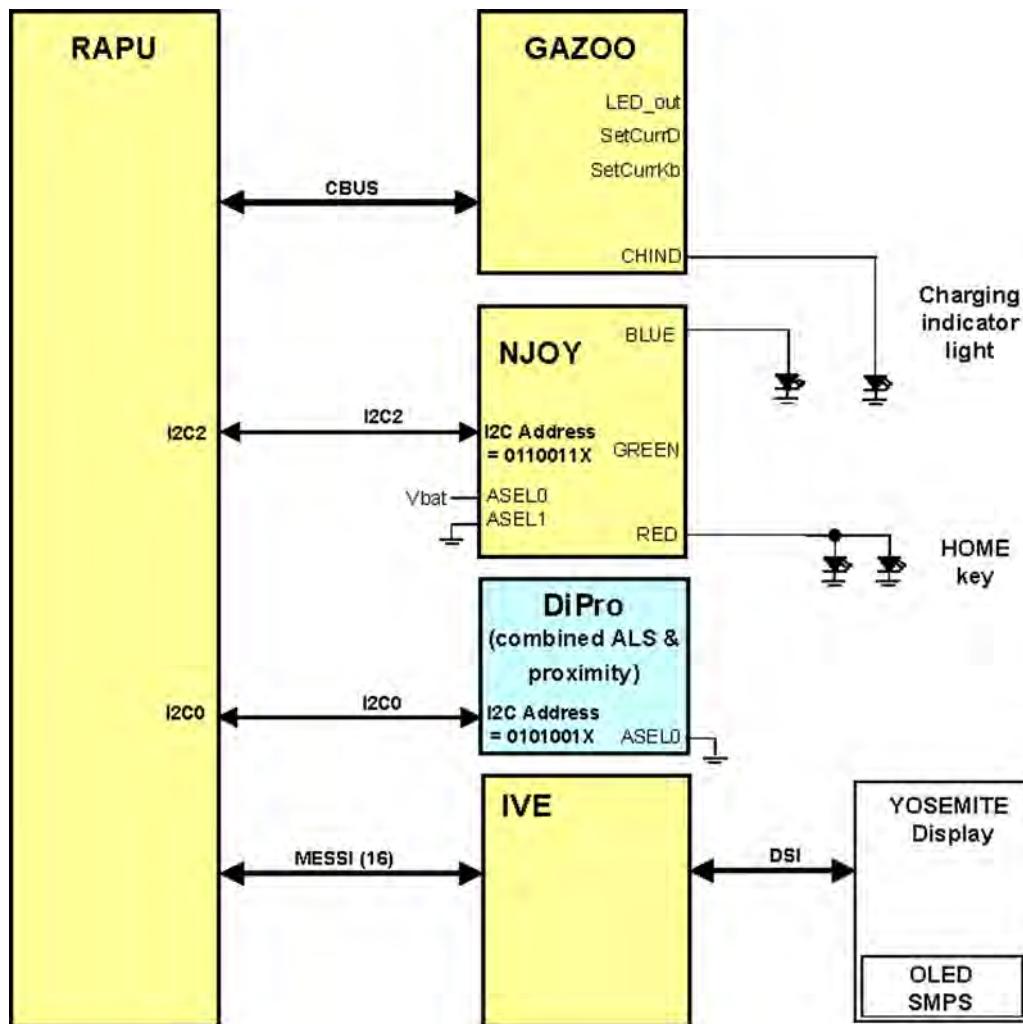

Figure 57 Illumination

Keyboard interface

The phone HW supports 42 keys for QWERTY keyboard, side keys (volume up/down slider, lock key, bi-functional camera shutter for half and full key press detection, and power key) and home key on lid. The side keys and home key are connected directly to RAPU GenIOs. The QWERTY keys are connected to a direct 36-pin IO-expander which is used in matrix mode.

Slide sensor

Slide sensor is a Hall2 sensor which also uses magnets for state switching. In this device it is used to detect the slide movement that reveals the Qwerty keyboard. The sensor is located on the Qwerty flex module and the magnet is located in the tilt assembly. The Hall sensor output generates interrupt to RAPU (GENIO26).

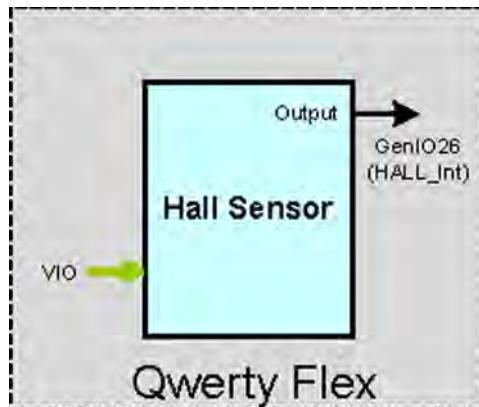

Figure 58 Hall sensor

Accelerometer

Accelerometer is a geometric type component which can be configured either to generate an inertial wake-up interrupt signal when a programmable acceleration threshold is exceeded along one of the three axes (x, y, and z), or to detect a free-fall event. Each axis has its own sensor and those can measure positive and negative directions.

The 3D accelerometer (N1103) Ahti_A sensor is connected to RAPU via two GENIOs ie Genio12 and Genio44 and I²C_0 bus. Power supply voltage is provided from VIO & VAUX2 output of EM ASIC.

It has the following features:

- 2.16V to 3.6V supply voltage
- 1.8V compatible IOs
- Low power consumption
- ±2g/±8g dynamically selectable scale
- I²C/SPI digital output interface
- Embedded self test
- 10000g high shock survivability
- Pb free/RoHS compliancy

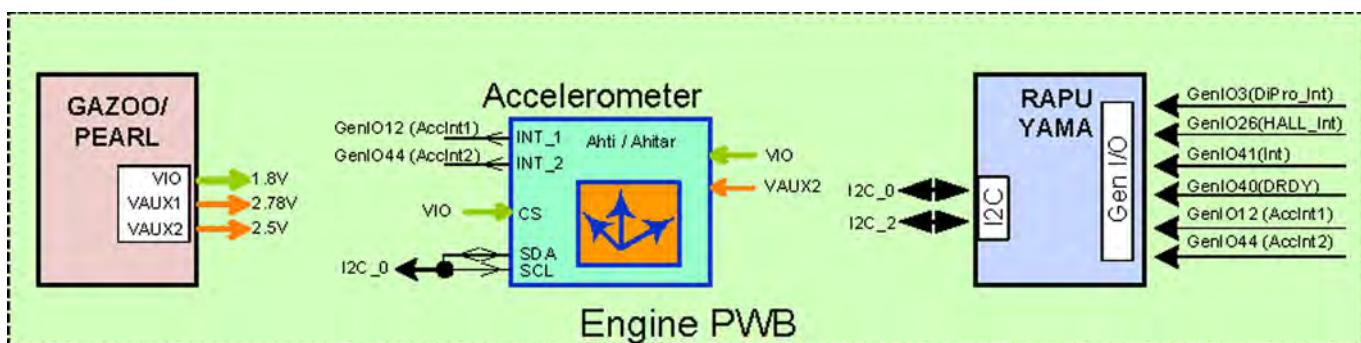

Figure 59 Accelerometer

Magnetometer

3D magnetometer sensor (N1105) is connected to RAPU via two GENIOs ie Genio40 and Genio41 and I²C_0 bus. Power supply voltage is provided from VIO & VAUX1 output of EM ASIC. The magnetometer is used as a city compass sensor. It detects the earth magnetic field density and composes bearing information for navigation applications.

The magnetometer has the following features:

- 3-axis magnetometer device suitable for compass application
- Built-in A to D converter for magnetometer data out
- Self test function
- I₂C bus interface
- Power modes: OFF mode, stand-by mode and active mode
- DRDY function for measurement data ready
- INT function to inform exceeding magnetic field strength threshold.

The operating temperature is -20°C to +85°C.

The operating supply voltages are:

- Analogue supply +2.4V to +3.6V
- Digital interface supply +1.70V to analogue supply voltage.

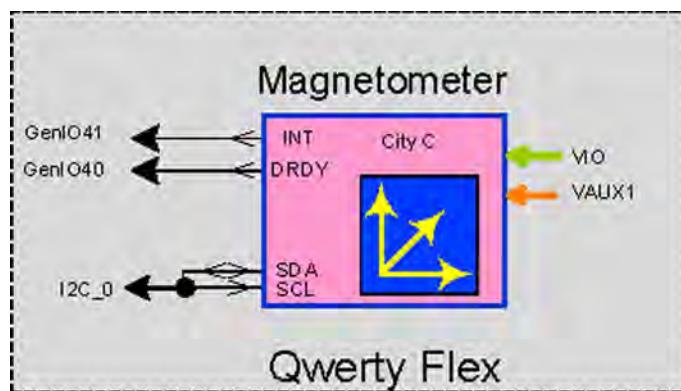

Figure 60 Magnetometer

■ Audio concept

Audio HW architecture

TPA6140 (N2000), BoostMono (N2150) along with mixed-signal ASIC Gazoo/Pearl provides the analogue audio output interfaces and RAPU provides the digital audio output interface support.

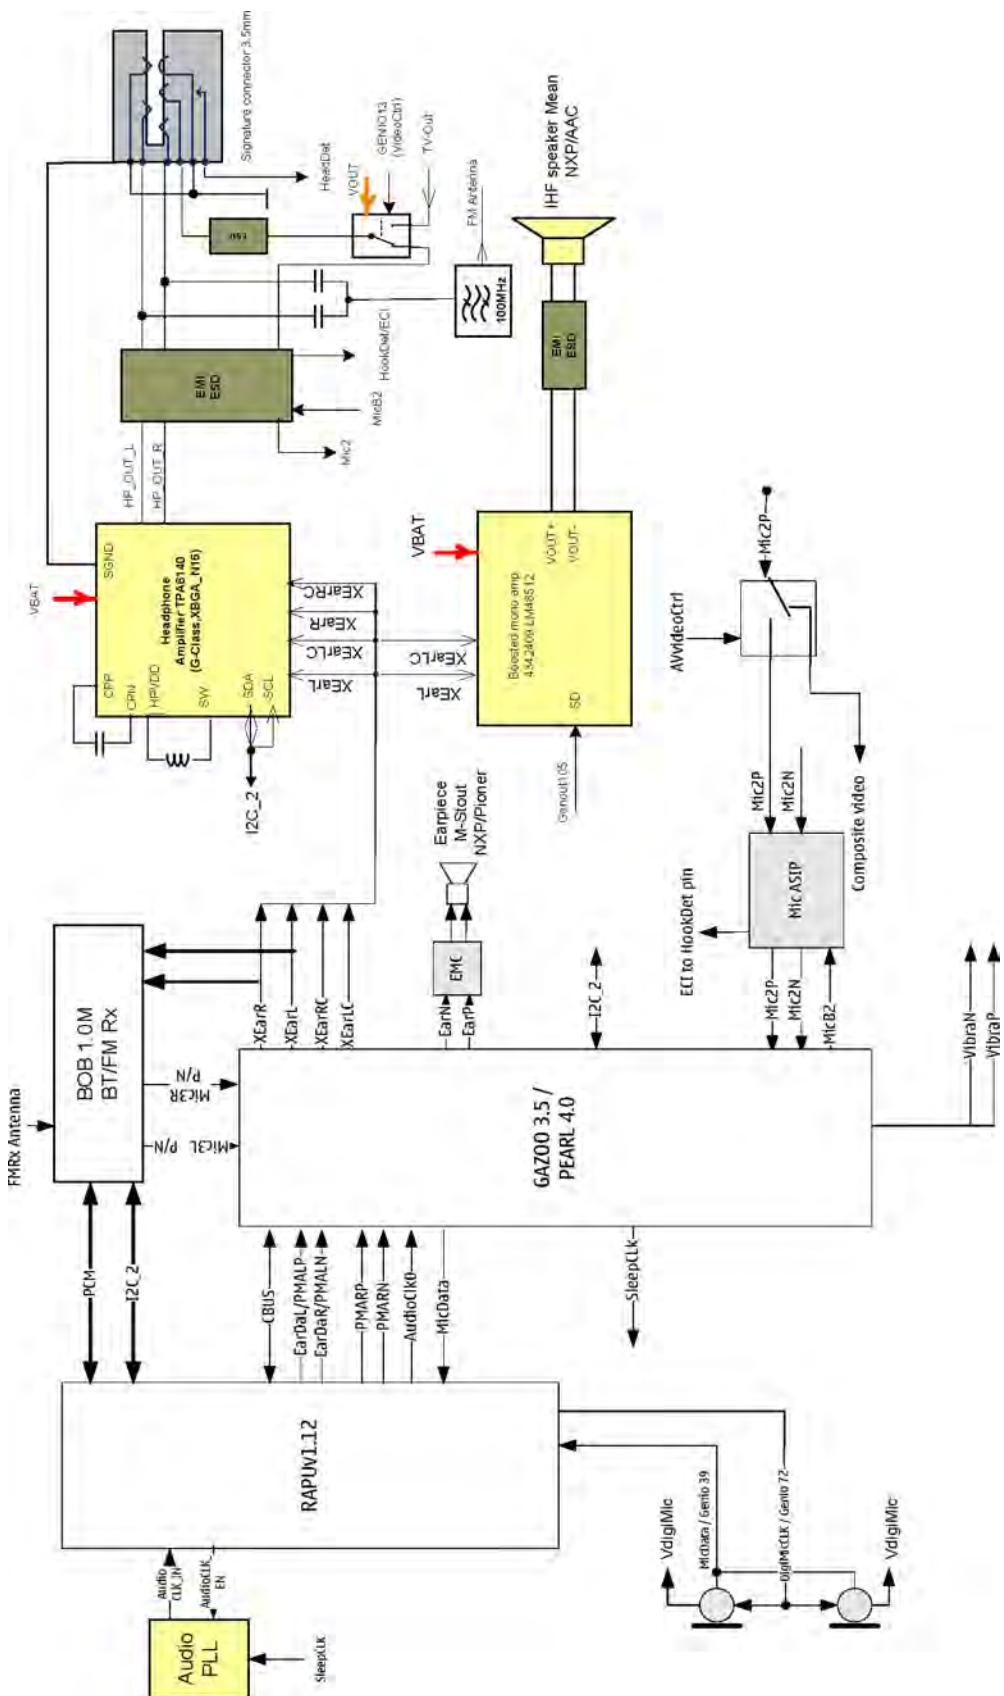

Figure 61 Audio block diagram

Internal earpiece

The internal earpiece used is MStout (8X12) and is connected to EM ASIC EARP and EARN lines.

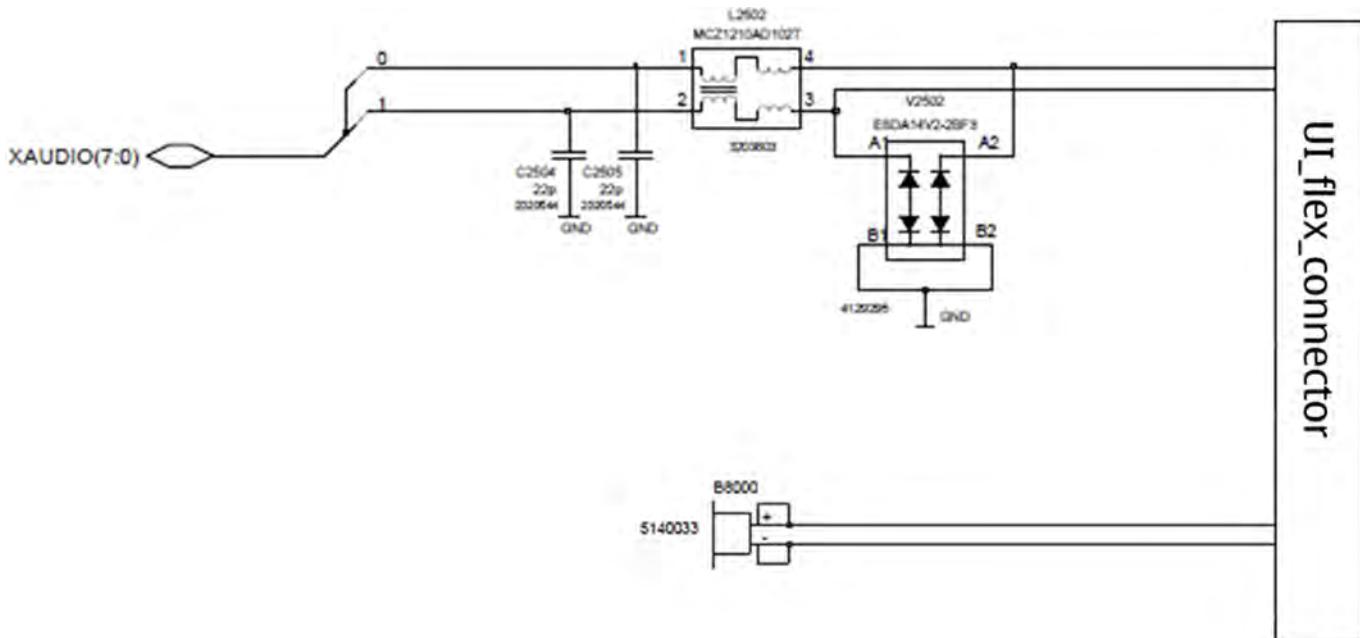

Figure 62 Internal earpiece diagram

Internal handsfree (IHF) speaker

IHF speaker used is Mean and is connected to BoostMono Vallu N2150. Vallu is a mono D-class speaker amplifier with an integrated inductive boost converter. Vallu's differential audio inputs are connected to EM ASIC Gazoo/Pearl XEarL, XEarLC and it can be enabled/disabled by Genout105 from Rapu.

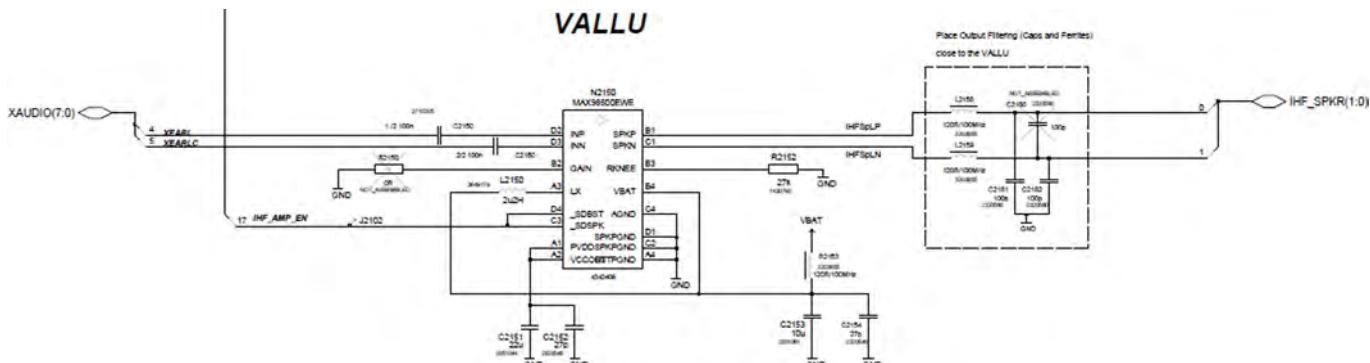

Figure 63 Internal handsfree (IHF) speaker diagram

Internal microphones

Digital microphones used are Knopfler and are connected to Rapu. DigiMic CLK is connected to RAPU Genio72 and DigiMic DATA is connected to Rapu Genio39.

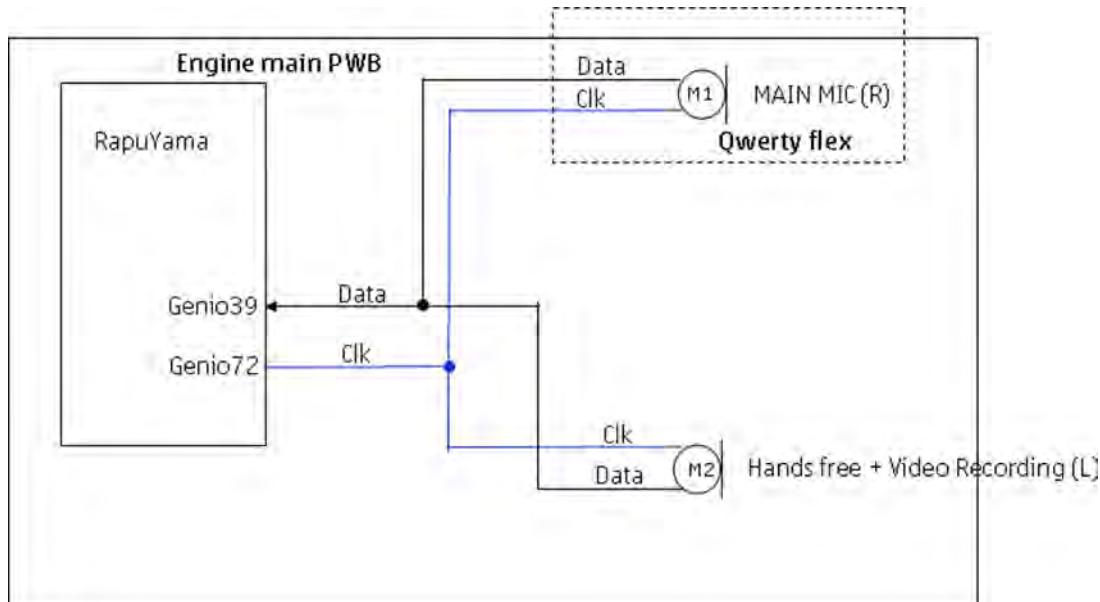

Figure 64 Internal microphones diagram

External earpiece and microphone

The AV headset earpiece is connected to TPA6140 audio amplifier which is used for high quality audio output and to guarantee long playback time for accessory use. TPA6140 is connected to Gazoo/Pearl XEarL, XEarLC, XEarR, XEarRC lines for audio and is controlled via I2C_2 bus by RAPU.

The AV headset microphone line is connected to EM ASIC Gazoo/Pearl Mic2 line via AV switch N2001.

Vibra

Vibra is connected to VibraP and VibraN lines of EM ASIC Gazoo/Pearl.

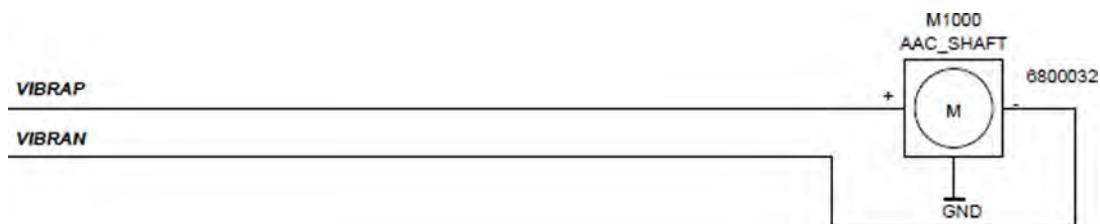

Figure 65 Vibra diagram

AV connector

The AV connector handles both audio and video signals output. It has audio left and right signals separately (pins 4 and 5) and the microphone signal wired to pin 3.

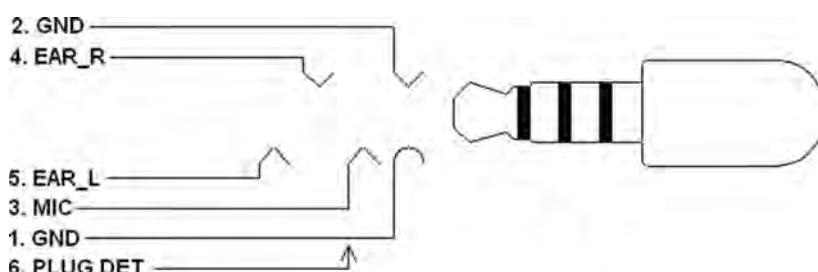

Figure 66 AV connector

The AVVideoControl signal handles microphone usage of the AV connector. The plug detection signal handles the AV connector plug detection with HeadDet signal from EM ASIC.

■ Cellular RF technical description

RF block

Linko RF consists of the following key components:

- Älli (Transceiver RF Asic)
- Aura (RF power management Asic)
- Ukko PA
- QuBBE (Front end module)

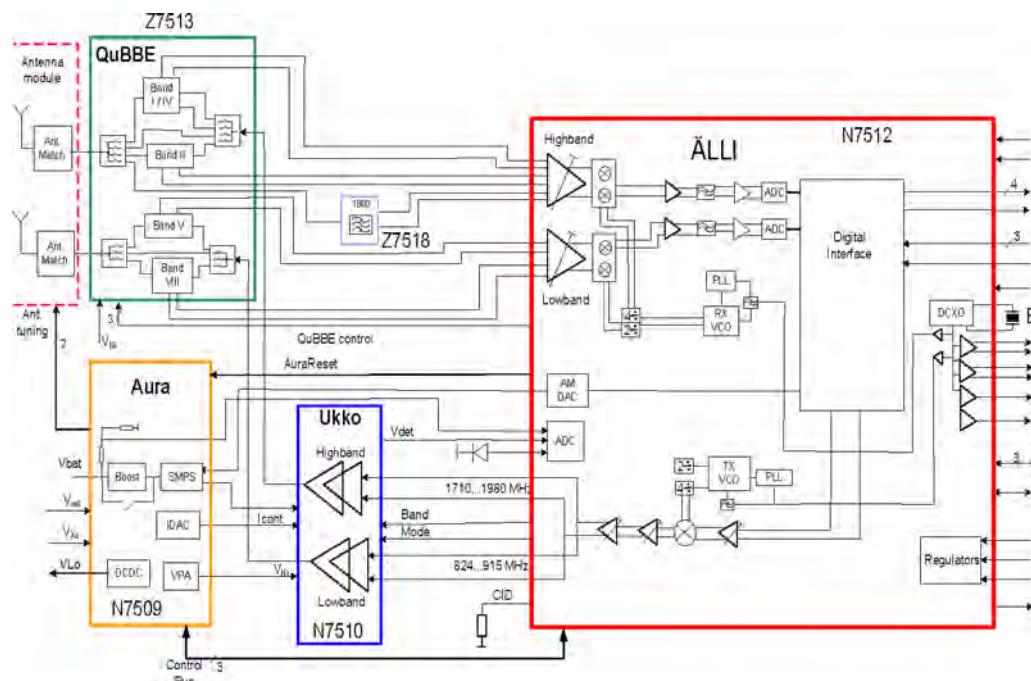

Figure 67 Linko RF block diagram

The RF block uses RF ASIC N7512 that performs the RF back-end functions of receive and transmit function of the cellular transceiver.

QuBBE

The front end module called QuBBE contains the needed front end filters and the switches. QuBBE contains:

- 3 duplexers (Band II, V, VIII)
- 1 triplexer (Band I, IV)
- 12 switches with the control
- Low and high band GSM TX low pass filters
- 50 ohms low and high and antenna interface

The control signals for the switches come from Älli.

Receiver (RX)

Linko RF has higher integration level compared to previous RF generations and especially more digital design blocks have been integrated to Älli, RF Asic.

Älli contains the receiver chain from LNAs to digital base band interface. Digital RX baseband interface contains four data and one clk signals. The data rate and clock frequency depend on the use case.

The main blocks in Älli are:

- LNAs: Balanced inputs for 850, 900, 1800, 1900, 2100 bands
- Passive mixer
- Analog baseband: Programmable for different modes
- ADC: Programmable Sigma Delta Modulator topology ADC
- RX Digital Front End (RXDFE): Contains for example digital filtering, DC offset compensation, wide/narrowband power measurement blocks

There is integrated external LNA matching on the bands 900, 1800, 1900 and 2100. On 850 band, there is an integrated matching.

Synthesizer

The synthesizer has separate highly integrated 4GHz VCOs for RX and TX. The integrator capacitors of the loop filter are outside of the IC. The PLLs are fractional type of dividers.

The reference oscillator is an on-chip 38.4 MHz digitally controlled oscillator. The 38.4 MHz crystal is outside of Älli. DCXO delivers the internal clock to Älli, differential clock signal to BB, and two single mode clock signals to NCW modules. Älli delivers a clk signal to diversity RX. The oscillator is controlled via RFBus with AFC signal. Temperature compensation of the oscillator is running by the SW in Älli. The temperature sensor itself is outside of Älli.

Transmitter (TX)

The main features of Linko1 transmitter are:

- Common PA for GSM and WCDMA
 - High and low band signal paths
 - Low band: 824 - 915 MHz
 - High band: 1710 - 1980 MHz
 - Two operation modes in PA
 - Saturation mode in GMSK usage
 - Linear mode in Edge and WCDMA usage
- No TX filter between PA and Älli
- Common regulators for GSM and WCDMA
 - Boost and SMPS regulators in Aura
 - Feeding the supply voltage to PA
 - Operation frequency varies depending on the used system

Frequency	SMPS	Boost	DCDC
WCDMA	3.0 MHz (typ)	4.5 MHz (typ)	1.3 MHz (typ)
GSM	9.5 MHz	7.5 MHz	2.7 MHz

- Digital interface to baseband
 - WCDMA mode
 - Digital IQ interface
 - 3 data and 1 clk signals

- GSM mode
 - GSM TX data bits are sourced from baseband via RFBus to Älli

In GMSK mode, the output level of Älli is kept high with all power levels, and the output power is adjusted by altering the collector voltage of PA. In practice, the output level of Älli is also slightly changed (optimized) in the highest power level to keep the PA compression level more constant, which results in better overall efficiency and performance.

In WCDMA and EDGE mode, the output power is tuned by output level of Älli. The supply voltage in WCDMA mode is adjusted in power levels to optimize the current consumption.

■ Frequency mappings

Nokia Customer Care

Glossary

(This page left intentionally blank.)

A/D-converter	Analogue-to-digital converter
ACI	Accessory Control Interface
ADC	Analogue-to-digital converter
ADSP	Application DPS (expected to run high level tasks)
AGC	Automatic gain control (maintains volume)
ALS	Ambient light sensor
AMSL	After Market Service Leader
ARM	Advanced RISC Machines
ARPU	Average revenue per user (per month or per year)
ASIC	Application Specific Integrated Circuit
ASIP	Application Specific Interface Protector
B2B	Board to board, connector between PWB and UI board
BA	Board Assembly
BB	Baseband
BC02	Bluetooth module made by CSR
BIQUAD	Bi-quadratic (type of filter function)
BSI	Battery Size Indicator
BT	Bluetooth
CBus	MCU controlled serial bus connected to UPP_WD2, UEME and Zocus
CCP	Compact Camera Port
CDMA	Code division multiple access
CDSP	Cellular DSP (expected to run at low levels)
CLDC	Connected limited device configuration
CMOS	Complimentary metal-oxide semiconductor circuit (low power consumption)
COF	Chip on Foil
COG	Chip on Glass
CPU	Central Processing Unit
CSD	Circuit-switched data
CSR	Cambridge silicon radio
CSTN	Colour Super Twisted Nematic
CTSI	Clock Timing Sleep and interrupt block of Tiku
CW	Continuous wave
D/A-converter	Digital-to-analogue converter
DAC	Digital-to-analogue converter
DBI	Digital Battery Interface
DBus	DSP controlled serial bus connected between UPP_WD2 and Helgo

DCT-4	Digital Core Technology
DMA	Direct memory access
DP	Data Package
DPLL	Digital Phase Locked Loop
DSP	Digital Signal Processor
DTM	Dual Transfer Mode
Dtos	Differential to Single ended
EDGE	Enhanced data rates for global/GSM evolution
EGSM	Extended GSM
EM	Energy management
EMC	Electromagnetic compatibility
EMI	Electromagnetic interference
ESD	Electrostatic discharge
FCI	Functional cover interface
FM	Frequency Modulation
FPS	Flash Programming Tool
FR	Full rate
FSTN	Film compensated super twisted nematic
GMSK	Gaussian Minimum Shift Keying
GND	Ground, conductive mass
GPIB	General-purpose interface bus
GPRS	General Packet Radio Service
GSM	Group Special Mobile/Global System for Mobile communication
HSDPA	High-speed downlink packet access
HF	Hands free
HFCM	Handsfree Common
HS	Handset
HSCSD	High speed circuit switched data (data transmission connection faster than GSM)
HW	Hardware
I/O	Input/Output
IBAT	Battery current
IC	Integrated circuit
ICHAR	Charger current
IF	Interface
IHF	Integrated hands free
IMEI	International Mobile Equipment Identity

IR	Infrared
IrDA	Infrared Data Association
ISA	Intelligent software architecture
JPEG/JPG	Joint Photographic Experts Group
LCD	Liquid Crystal Display
LDO	Low Drop Out
LED	Light-emitting diode
LPRF	Low Power Radio Frequency
MCU	Micro Controller Unit (microprocessor)
MCU	Multiport control unit
MIC, mic	Microphone
MIDP	Mobile Information Device Profile
MIN	Mobile identification number
MIPS	Million instructions per second
MMC	Multimedia card
MMS	Multimedia messaging service
MP3	Compressed audio file format developed by Moving Picture Experts Group
MTP	Multipoint-to-point connection
NFC	Near field communication
NTC	Negative temperature coefficient, temperature sensitive resistor used as a temperature sensor
OMA	Object management architecture
OMAP	Operations, maintenance, and administration part
Opamp	Operational Amplifier
PA	Power amplifier
PCM	Pulse Code Modulation
PDA	Pocket Data Application
PDA	Personal digital assistant
PDRAM	Program/Data RAM (on chip in Tiku)
Phoenix	Software tool of DCT4.x and BB5
PIM	Personal Information Management
PLL	Phase locked loop
PM	(Phone) Permanent memory
PUP	General Purpose IO (PIO), USARTS and Pulse Width Modulators
PURX	Power-up reset
PWB	Printed Wiring Board

PWM	Pulse width modulation
RC-filter	Resistance-Capacitance filter
RDS	Radio Data Service
RF	Radio Frequency
RF PopPort™	Reduced function PopPort™ interface
RFBUS	Serial control Bus For RF
RSK	Right Soft Key
RS-MMC	Reduced size Multimedia Card
RSS	Web content Syndication Format
RSSI	Receiving signal strength indicator
RST	Reset Switch
RTC	Real Time Clock (provides date and time)
RX	Radio Receiver
SARAM	Single Access RAM
SAW filter	Surface Acoustic Wave filter
SDRAM	Synchronous Dynamic Random Access Memory
SID	Security ID
SIM	Subscriber Identity Module
SMPS	Switched Mode Power Supply
SNR	Signal-to-noise ratio
SPR	Standard Product requirements
SRAM	Static random access memory
STI	Serial Trace Interface
SW	Software
SWIM	Subscriber/Wallet Identification Module
TCP/IP	Transmission control protocol/Internet protocol
TCXO	Temperature controlled Oscillator
Tiku	Finnish for Chip, Successor of the UPP
TX	Radio Transmitter
UART	Universal asynchronous receiver/transmitter
UEME	Universal Energy Management chip (Enhanced version)
UEMEK	See UEIME
UI	User Interface
UPnP	Universal Plug and Play
UPP	Universal Phone Processor
UPP_WD2	Communicator version of DCT4 system ASIC

USB	Universal Serial Bus
VBAT	Battery voltage
VCHAR	Charger voltage
VCO	Voltage controlled oscillator
VCTCXO	Voltage Controlled Temperature Compensated Crystal Oscillator
VCXO	Voltage Controlled Crystal Oscillator
VF	View Finder
V _{p-p}	Peak-to-peak voltage
VSIM	SIM voltage
WAP	Wireless application protocol
WCDMA	Wideband code division multiple access
WD	Watchdog
WLAN	Wireless local area network
XHTML	Extensible hypertext markup language
Zocus	Current sensor (used to monitor the current flow to and from the battery)

(This page left intentionally blank.)
